

My idea is for some company to make some device that can replace/rid a user of a long phone cable hanging across the floor, leaving room for someone to trip over thus resulting in the modem possibly being pulled on the floor, resulting in damaged hardware. This is just a concept idea from me. Although I'm sure there will be some major technical ideas to be made out for any company willing to do this, in my opinion would be a very profitable idea anyway. Since there is a product <that transmits at 900MHz> that lets you listen to music at CD quality from anywhere in the home, I felt that it wouldn't be too difficult to add this feature to an analog signal over a telephone line.
