1.6 Getting started

```
                GETTING STARTED
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

If you have installed Executive normally and rebooted you machine,
it's now running and you can proceed. If not, go ahead and install it,
it's very easy to uninstall it later using the uninstall script.

Executive consists of a
                server
                 and
                clients
                . The server is run in the
background and most of the clients require it to be running to work.

In a few words, Executive adds a better task scheduler to your Amiga
and provides similar services as programs like Job Manager or SPY system.

No similar programs for Amiga have been made before, so you may not
exactly know what Executive is all about, but give it a little time and
read the documentation and you won't regret it!

UNREGISTERED VERSION

These features require a registered version of Executive:

  * All schedulers except STANDARD
  * Accounting
  * ALoad3D

The absence of these features doesn't make Executive unusable. You can
use Executive without these features but I hope you'd
                register
                 after
you have seen what this program is.

BUGS

If you happen to find a bug or have a suggestion for improving Executive
please contact me using one of the ways listed
                here
                .

If you want to report a bug, please include the following information:
```

- Your Amiga hardware (Amiga type, CPU, memory)
- Your AmigaDos operation system version
- Other relevant software running on your system
- Executive version

If you can find the necessary steps to reproduce the bug, that would be great and help me a great deal.

1.7 Introduction

INTRODUCTION

Multitasking basics

Different kinds of tasks

Scheduling

Executive features and requirements

How does it work?

Installed files

1.8 Multitasking basics

MULTITASKING BASICS
~~~~~~~~~~~~~~~~~~~

Multitasking is something that Amiga users have been enjoying for 10 years, while others are still arguing if multitasking is a useful feature in an operating system. You are probably familiar with multitasking, but I'd like to clarify some terms and draw an overall picture of different ways to implement multitasking. This will help you understand what Executive has to offer for you.

MULTITASKING ON AMIGA

The kind of multitasking Amiga has is called preemptive prioritized Round-Robin. Each task has a priority assigned to it. The task with the highest priority and is ready to run, will be run. A task can be in one of three states: sleeping, ready or running.

* A ready task is not currently using the CPU but is waiting to use it. Exec keeps a sorted list of the tasks that are ready. The list is sorted according to task priority, so Exec can easily find the ready task with the highest priority.

* A sleeping task is not currently running and is waiting for some event to
  happen. When that even occurs, Exec will move the sleeping task into the
  list of ready tasks.

* A running task is currently using the CPU. It will remain the current
  task until one of these three things occurs:

  o A higher priority task becomes ready, so Exec preempts the current
    task and switches to the higher priority task.

  o The currently running task needs to wait for an event, so it goes to
    sleep and Exec switches to the highest priority task in Exec's ready
    list.

  o The currently running task has had control of the CPU for at least a
    preset time period called a quantum and there is another task of equal
    priority ready to run. In this case, Exec will preempt the current task
    for the ready one with the same priority. This is known as time-slicing
    or "Round-Robin". When there is a group of tasks of equal priority on
    the top of the ready list, Exec will cycle through them, letting each
    one use the CPU for a quantum.

  The term preemptive prioritized Round-Robin comes from these
  three things.

PREEMPTIVE VS. COOPERATIVE

Preemptive multitasking means that the operating system can force a task
to give the CPU to another task. Some operating systems have cooperative
multitasking, mainly because they are old and their developers didn't see
any need for better multitasking (or for any kind of multitasking) when
the OS was developed. It's usually not possible to implement preemptive
multitasking afterwards, so cooperative multitasking must be used.

In cooperative multitasking operating system tasks must handle the
multitasking, i.e. do someone else's homework.

PRIORITIES

Amiga uses fixed priorities. Most user tasks have a priority 0 or 1.
Tasks that require CPU time before user tasks, for example device drivers,
have a priority 5. Harddisk partitions and disk drives have a priority 10
and the highest priority is usually 20, for input.device that handles all
input from mouse and keyboard.

The priority range is -128 to +127. Negative priorities are usually used
for tasks that require all the CPU time they can get, for example
rendering programs. As a general rule, you shouldn't raise the priority
of any task above 3.

1.9 Different kinds of tasks

DIFFERENT KINDS OF TASKS
~~~~~~

Tasks can be divided in to two categories:

  * transput-bound
  * compute-bound

Transput-bound tasks spend most of their time waiting for some event
to occur. Transput-bound tasks can be interactive or non-interactive.
An example of an interactive transput-bound task is a text editor, it
spends most of the time sleeping, waiting for a keypress. Device drivers
are non-interactive transput-bound tasks.

Compute-bound tasks spend their time using as much CPU time as they
can get. Compute-bound task can also be interactive. An example of this
kind of task is a program that lets you rotate a three dimensional object
on the screen with the mouse. Most compute-bound tasks are non-interactive,
like a rendering program or a compiler.

1.10 Scheduling

SCHEDULING
~~~~~~

The goal of scheduling is to provide good service to all tasks that are
currently competing for the computing resource, that is, the execution
of instructions.

DIFFERENT TASKS HAVE DIFFERENT NEEDS

A personal computer like Amiga usually has non-interactive transput-bound
tasks, interactive transput-bound tasks and non-interactive compute-bound
tasks. Different kinds of tasks must be given different treatment:

  * consistent response time for interactive transput-bound tasks
  * small response time for non-interactive transput-bound tasks
  * good throughput for compute-bound tasks

Interactive transput-bound tasks require immediate response to every
event, otherwise the user might get very frustrated. Failing that,
consistent response is better than good average response. Response to a
keypress that always takes about 2 seconds is better than response that
averages about 1 second but occasionally takes 10 or only 0.5.

Non-interactive transput-bound tasks require fast response to events,
because otherwise they'll be delayed. For example, consider a task that
needs to compute for 1 millisecond and then wait 20 milliseconds for an
event to occur. This will be repeated 1000 times. This would require
1 second of computation and 20 seconds of waiting, a total of 21 seconds.
But if the task is delayed half a second every time it becomes ready, it
will take 521 seconds. A small average delay will pay off handsomely,
even if some delays are longer. A 1-millisecond average delay will allow

the task to finish in 22 seconds.

Compute-bound tasks require lots of CPU time, and the overhead should be minimized, i.e. the number of task switches should be minimized. A context switch on AmigaDos is much faster than in some larger operating systems. Here are some context switch speeds in different machines/ operating systems (in microseconds):

```
   26   25MHz Amiga A4000/040 AmigaDos 3.1
  106     66MHz Snake HP-UX 9.x
  128     40MHz Viking SunOS 4.1.3
  150     25MHz Amiga A2000/030 AmigaDos 2.1
  210     33MHz 486 386BSD 0.1
  212     50MHz RIOS AIX 3.2
```

HOW DO WE DISTINGUISH DIFFERENT KINDS OF TASKS?

This is a bit technical and you may want to
skip
it.

To make scheduling decisions, the scheduler must first distinguish the category where a certain task belongs. This can be very difficult because the same task can drift from one category to another while it’s running.

For example, a text editor is usually interactive transput-bound task, but when user starts a search & replace-function, it might become interactive compute-bound task. When it’s saving text to a disk, it becomes non-interactive transput-bound. This means that the scheduler must adapt to different situations while the task is running. The best scheduler would be the one that could predict the future.

When implementing a scheduler the usual approach is to give priorities to each task and then modify these while the task is running. The simplest form of this is a decreasing priority scheduler where the priority of a task decreases continuously as it uses processor time, and the scheduler runs higher priority tasks first. Operating system called Multics used such a scheduler and discovered its major disadvantage, that on a heavily loaded system with significant numbers of short-lived tasks the priority of a lengthy task can decrease to a point where little or no further processor time is available to it.

To avoid the problem of permanently depressed priorities it is necessary to elevate them in some manner. There are two major choices for elevation methodologies: event-based elevation and processor usage aging. Event-based elevation is used to deliberately favor interactive response over compute-bound tasks because task priority is elevated by the occurrence of events such as keypress. This methodology assumes that tasks are either distinctly compute-bound or distinctly interactive (transput-bound) and that interactive tasks are more important. Tasks whose interactive work consumes large amounts of processor time may not do well under this methodology. The VAX/VMS scheduler employs this elevation methodology.

The second priority elevation methodology is processor usage aging. A scheduler that uses this methodology elevates priorities by gradually forgetting about past processor usage, usually in an exponential fashion.

As a result, the scheduler's measure of processor usage is an exponentially weighted average over the lifetime of a task. A simple exponential average is not desirable because it has the unexpected side effect of raising priorities when the load on the system rises. This happens because under higher load each task gets a smaller share of the processor, so its usage average drops, causing its priority to rise. These elevated priorities can degrade system response under heavy loads because no task accumulates enough usage to drop its priority. The 4.3BSD version of Unix solves this problem by making the aging rate depend on the load average, so that aging is slower in the presence of higher load, keeping priorities in approximately the same range.

DOES AMIGA NEED A BETTER SCHEDULER?

A better scheduler would be useful. It would free you from constantly adjusting task priorities.

There are many situations where Amiga slows down so much that it basically becomes a single-task machine. For example, you might be printing a large document from a wordprocessor and it would take too much time to load another program so you'll just wait for the wordprocessor to finish.

When you start a time consuming task, you have to manually lower its priority before or after so that you can run other programs. For a 'power user' this soon becomes a nuisance.

It's also easy to lock up the machine by raising the priority of a task, that wants to use all processor time, too high.

I have also run into problems with text editors. Their priority is usually 1 or 2, so they are above normal CLI-tasks. When you load a large text-file to a text-editor and start a time consuming operation, for example macro execution or a vertical cut in CygnusEd, you can't do anything else before the operation finishes.

A better scheduler would handle situations like these automatically, without any user interaction.

1.11 Executive features and requirements

EXECUTIVE FEATURES AND REQUIREMENTS
~~~~~~

Executive is

* a scheduler
* a task management system

Executive is similar to Job Manager or Spy System, but it has more features than these two together!

Executive doesn't use any illegal programming, it is fully compatible with all Amiga computers running AmigaDos release 2.04 or newer.
~~~~~~

Executive has been carefully designed to work with all kinds of
configurations and care has been taken not to break any programming
rules.

Executive is a client-server application. The server is usually started
when the machine is booted. It will install the scheduler (optional) and
collect statistics of CPU usage. Clients are used to query information from
the server.

Here's a list of major features in Executive:

  * 6 different schedulers
  * focus - task with active window gets more CPU time
  * accounting
  * load averages
  * accurate (1/1000 seconds) CPU usage calculation
  * tracks child-parent relationships
  * process identifiers, process groups
  * support for
                multiuser.library
                  * sysinfo.library for user-implemented clients

Other important things:

  * localized
  * on-line help
  * Most GUI-based clients available with GadTools and MUI interfaces
  * server and clients use memory pools, no memory fragmenting
  * works with Nicola Salmoria's SetManager

Here's a list of client-programs included:

                acct
                            accounting daemon

                ALoad
                           display load average

                ALoad3D
                         display load averages in 3D

                Commander
                       general task manager

                ctp
                             extended ChangeTaskPri

                kill
                            extended Break

                lastcomm
                        list last commands executed

                nice
                            run programs with lower scheduling priority

```
                ps
                             process status displayer

                pstree
                          display child-parent relationships

                renice
                          renice a task

                sa
                             print accounting statistics

                stat
                           display some misc. information

                timer
                           time CLI and Workbench programs

                top
                             display information about the top CPU tasks

                uptime
                          display system uptime and load averages

Will those clients run from CLI only?

  A student asked the master for help... does this program run from the
  Workbench? The master grabbed the mouse and pointed to an icon. "What is
  this?" he asked. The student replied "That's the mouse". The master
  pressed control-Amiga-Amiga and hit the student on the head with the
  Amiga ROM Kernel Manual.
    -- Amiga Zen Master Peter da Silva
```

1.12 How does it work?

```
                HOW DOES IT WORK?
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

The first thing that must be done is to start the server. Most of the
clients require that the server is running because they need to get
information from it. Server should be started as early as possible,
preferably in startup-sequence, but it can be started and stopped
later too.

When the server starts, it reads the preferences file. Most of the options
can also be specified in tooltypes and on command line. You can modify
the preferences with the
                ExecutivePrefs
                 preferences program.

The server will patch
                some functions
                 in exec.library and intuition.library.
```

It necessary to run the server at a very high priority, currently at 126, otherwise the CPU usage calculations would not be accurate. This won't cause any problems with other tasks because Executive needs the only for a very brief moment.

Executive doesn't replace Exec task dispatching functions, it just recalculates task priorities for scheduled tasks every second. Two priority ranges are needed. The first one is called "catch range" and the other is "dynamic range".

Catch range

Tasks that have priority inside the catch range will be automatically scheduled. The default range is from -105 to +2.

Dynamic range

When the scheduler calculates a new priority for a task, it will be in this range. The default range is from -100 to -50. This means, that a task that uses little or no CPU time, will get priority close to -50. Tasks that use much CPU time will have priority near -100.

So, not all tasks are scheduled automatically. You can still run programs with priority above and below the catch range. For example, input.device will run at priority 20 as usual.

Different schedulers calculate the priority in different way, but they all use a nice-value associated with each task. Nice-value is usually 0, but it can be used to give more CPU time to some tasks. The nice-value is in range -20 to +20. Unlike priorities on Amiga, a NEGATIVE number gives MORE CPU time to a task, i.e. it will be less nice to other tasks.

Another thing common to all schedulers is the focus-feature. The task that has opened the currently active window gets more CPU time than others. This feature can be turned off.

When using a scheduler you can specify certain tasks that will be watched and some action will be taken when a task with the name you specified is created. This feature is need when you don't want to schedule a task whose priority falls in the catch range or you especially want to schedule some task that has priority outside the catch range. It's also possible to give default nice values or priorities for tasks when they are created.

The main use for this is to make sure that some programs like telecommunication programs are not scheduled, because that might drop their priority too low and cause errors in transfer.

The watched tasks feature is also used to specify certain tasks that should totally be ignored. There's currently only one task that must be ignored. The SAS/C Development System has a debugger called CPR which creates a task called 'VISOR input processor'. This task is not removed in a legal way (RemTask() is not called), so it will cause problems with programs like Executive. But this will be handled AUTOMATICALLY by Executive, so there's no need to worry about it.

There's absolute no need to ignore any other tasks.

When the server is running, you can start up some clients, for example
Top and ALoad. When a client is running, you can't quit the server.

1.13 Patched functions

```
PATCHED FUNCTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  exec.library

    AddTask()
    RemTask()
    SetTaskPri()
    Switch()

  intuition.library

    CloseWindow()
    OpenWindow()
    OpenWindowTaglist()

  ExecBase

    ex_LaunchPoint
```

1.14 Installed files

```
INSTALLED FILES
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

All Executive files, except a locale catalog are installed to a single
directory. The preferences file, "Executive.prefs" is initially written
to this directory, but Executive will also search it from these
directories:

  current directory
  PROGDIR: (directory where the program binary is)
  ENV:
  S:

These directories are also searched for the keyfile, "Executive.key".

A preferences file containing all the defaults is written during
installation to the install directory. It also contains the BASEDIR
option:

  BASEDIR       "WORK:Executive"

This is the directory where Executive was installed. The AmigaGuide
document file is searched from this directory when you start a client
```

from CLI with the HELP option or press the HELP-key when using a client
with a GUI. These directories are also searched for the documentation
file:

  PROGDIR:Help/<language>/
  HELP:<language>/   (AmigaDos V39+)
  PROGDIR:
  Current directory

The locale catalog is installed if you are using AmigaDos 2.1 or newer.
AmigaDos 2.04 doesn't support localization. The catalog is installed
to LOCALE:Catalogs/<language>/Executive.catalog.

To uninstall Executive click on the UnInstall icon and follow given
instructions. This will safely remove Executive from your harddisk.

MOVING EXECUTIVE TO ANOTHER DIRECTORY
~~~~~~

Experienced users may want to move Executive to another directory.
Here's how to do it:

  Copy the server and clients to a directory that is in your path,
  for example C:.

  Copy the keyfile and the preferences file to your S: directory.

  Copy the AmigaGuide manual to HELP:<your default language>/ directory.

  Remove the BASEDIR line from the preferences file.

  Remove the Path-command from S:User-Startup file and change the
  path to the Executive binary.

  If you don't use Workbench, you can delete all the icons.

Of course the supplied UnInstall script can't be used anymore, so you
can delete it.

1.15 Background

BACKGROUND
~~~~~~

Development of Executive was started when I had a debate about process
scheduling on AmigaDOS and on OS/2. At the same time I also bought a bigger
harddrive, so I could install NetBSD, the free Unix operating system for
Amiga. NetBSD has a "real" scheduler, and I wanted to have something
similar in AmigaDOS.

So I started with the project. There weren't any similar programs available
for Amiga, so I had to improvise. The first version used to calculate CPU
usage by patching launch and switch vectors in every task structure. This
was a bad idea and it wouldn't have worked with tasks that wanted to use

these or the userdata field. So I changed the code so that the CPU usage
was calculated using a vertical blanking interrupt. I incremented a counter
for each task if they were being run when the interrupt occurred. This
worked and it was very efficient, but the accuracy was only 1/50 second,
and in practice it was even less, because tasks that used CPU only between
two vblanks didn't seem to use CPU at all. The current method for
calculating CPU usage is explained
                elsewhere
                , so I won't repeat it
here.

1.16 Server

                SERVER
~~~~~~

                Starting the server

                Making it work

                Options

                Server internals

                Quitting the server
                    Start server

    Stop server

1.17 Starting the server

                STARTING THE SERVER
~~~~~~

If you have installed Executive normally, it will be started when your
machine is booted.

It's possible to start Executive anytime you want to, but then it's
not possible to resolve existing child-parent relationships and the

                pstree
                 can't display them.

Also, if you want the focus-option to work properly, you should start
Executive before any windows have been opened.

The server can be started from Workbench or CLI. It must be 'run' from
CLI, so use this command to start it:

```
   run <NIL: >NIL: Executive
```

1.18 Making it work

```
MAKING IT WORK
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

PRIORITY RANGES

Every task in Amiga has a priority which varies from -128 to +127.
The priority is fixed and is usually only changed by the user. Executive
will change priorities automatically and give lower priority to tasks
that want to use much CPU time and higher priority for tasks that use
less CPU time. Executive reserves a range of priorities called dynamic
range where it places the scheduled tasks. The default range, -50 to -100
is normally unused, so it's a good place, but a different can be specified.

The dynamic range MUST be inside another priority range, called catch
range. By default, the catch range is from +2 to -105. Every task that
is started, or whose priority is later changed to a value in this range,
will be scheduled. If some task is being scheduled and its priority
is changed to some value outside the catch range, it won't be scheduled
any more.

This is a crude map of priorities explained above:

  +127 - +
  +126 - | Executive server runs at this priority, +126.
         |
         |
         |
         |
         |
         |
    +2 - | <-----------------------------------.
     0 - +                                     | By default, tasks with a
         |                                     | priority from +2 to -105
         |                                     | will be 'catched' by the
   -50 - | <--. Scheduled tasks will be        | server and they will be
         |    | assigned a priority from       | scheduled.
         |    | this area, the dynamic range,  |
  -100 - | <--' by default from -50 to -100.   |
  -105 - | <-----------------------------------'
         |
  -128 - +

The maximum dynamic range and catch range is from -125 to +125.
The dynamic max - dynamic min must be at least 2.

If you don't use any of the schedulers, then you don't have to
care about any priority ranges.

Why it's necessary to run the server with so high priority? Is it
dangerous? No, it isn't. The server needs to be run with a priority above
```

all other tasks so it can always be run when it needs to, otherwise CPU usage calculation would not be correct. Please don't run any other tasks with priority 126 or higher, it will affect CPU usage calculations.

WATCHED TASKS

Usually you want to schedule all tasks that have their priority in the catch range. But there are some programs that shouldn't be scheduled for certain reasons. For example, a telecommunication program (NComm, Terminus, Term, ...) shouldn't be scheduled because its priority may drop below some other time consuming tasks and then it wouldn't get all the CPU time that it needs. This might result in transfer errors. So you must run this task with a priority above the catch range, or tell Executive not to schedule this task, even if its priority is in catch range. Task's priority won't be changed, if it isn't in the dynamic range, where the scheduled tasks are. If task's priority is in the dynamic range, its priority will automatically be raised above the dynamic range.

If the telecommunication program has an option to set its priority, you should use it. If no such option is available, then tell Executive to handle it (this will be explained later). If the telecommunication program is not started from Workbench or RUN from CLI, Executive won't notice it, because a new task won't be created.

So, Executive watches new tasks checks if their name matches a task in its watched tasks list. If it does, some of these actions might be taken:

* Keep the priority of a task above or below the dynamic range and don't schedule the task.

* Schedule a task even if its priority is not in the catch range. You can also specify a default nice-value for this task.

* Don't schedule a task but set its priority to a specified value. The priority can be changed afterwards. You probably won't need this.

These actions can be applied to the specified task OR its childtasks.

Sometimes when a process (not a task but process) is created (e.g. with RUN command from CLI), it's possible that the process name is not available immediately upon invocation. Executive will wait for approximately one second before it checks if this process is being 'watched', the name should then be correct.

Task names are case insensitive, and you can use * as a wildcard. For example, '*ed' will match all task names that end to 'ed'. If the task is a CLI process, then the CLI command name will be used.

Workbench is a special task that shouldn't be scheduled, because it would make Workbench rather unresponsive. This is built-in, so you don't have to worry about it. It's still possible to schedule the Workbench, if you prefer it that way, there's an option to do this.

```
Rarely it's necessary to totally ignore a task. Currently I know of only
one task that must be ignored. The SAS/C Development System has a
debugger called CPR which creates a task called 'VISOR input processor'.
This task is not removed in a legal way (RemTask() is not called), so it
will cause problems with programs like Executive. But this will be
handled AUTOMATICALLY by Executive, so there's no need to worry about it.

There's absolute no need to ignore any other tasks at the moment, but
it's possible. If you ignore a task, then Executive clients don't
know anything about the ignored task.
```

1.19 Server options

```
                SERVER OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Before parsing command line options or tooltypes, the server reads a
preferences file. The easiest way to change the preferences file is to
use the
                ExecutivePrefs
                 utility. If you want to edit preferences
file by hand then please read the
                preferences file
                 documentation.

It's not possible to change any options on the fly, you must always
restart the server.

If the server is started from Workbench, tooltypes will be read, otherwise
CLI arguments are parsed. The server understands these CLI arguments and
tooltypes:

CATCHMAX

  Template:  CATCHMAX/N/K
  Tooltype:  CATCHMAX
  Default:   2

  The highest priority a task can have to be catched by the server and
  scheduled.

CATCHMIN

  Template:  CATCHMIN/N/K
  Tooltype:  CATCHMIN
  Default:   -105

  The lowest priority a task can have to be catched by the server and
  scheduled.

DYNAMICMAX

  Template:  DYNAMICMAX/N/K
  Tooltype:  DYNAMICMAX
  Default:   -50
```

```
  The upper bound for dynamic range.

DYNAMICMIN

  Template:  DYNAMICMIN/N/K
  Tooltype:  DYNAMICMIN
  Default:   -100

  The lower bound for dynamic range.

NOFOCUS

  Template:  NOFOCUS/S
  Tooltype:  NOFOCUS
  Default:   Focus option is ON by default

  If you specify this switch, the focus-option is disabled. By default,
  the task that owns the active window gets more CPU time.

SCHEDWB

  Template:  SCHEDWB/S
  Tooltype:  SCHEDWB
  Default:   Workbench is not scheduled by default

  Workbench is not scheduled, because that would cause noticeable
  slowdown in performance. Use this switch to schedule Workbench.

TIMER

  Template:  TIMER/K
  Tooltype:  TIMER
  Default:   CIA-A

  Which
                timer
                 to use:

    CIA-A
    CIA-B
    DEVICE (timer.device)

SCHEDULER

  Template:  SCHEDULER/K
  Tooltype:  SCHEDULER
  Default:   STANDARD

  Which
                scheduler
                 to use:

    SIMPLE
    STANDARD
    MARKET
    REMEMBER
```

```
    QUEUES
    SUPER

  Specify NONE if you don't want to use any scheduler.

QUIT

  Template:  Q=QUIT/S
  Tooltype:  QUIT

  This will tell the server to quit and remove itself. For more
  information about quitting the server, see
                here
                .

HELP

  Template:  HELP/S
  Tooltype:  HELP

  Display on-line help-file for the server.

VERSION

  Template:  VERSION/S
  Tooltype:  -

  Display version number.
```

1.20 Quitting the server

```
                QUITTING THE SERVER
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

You can quit the server by issuing this command:

  Executive QUIT

or run the 'Executive' -program from Workbench and you'll be asked if
you want quit Executive. The above command doesn't do anything if
Executive isn't running.

When the server quits, it will first signal
                acct
                 to write all unpurged
accounting records to disk.

You might get this message when you try to quit the server:

  Unable to quit. Some program has patched a
  function in Exec or Intuition library.

This means that you have run a program after the Executive server
which has patched one or more of the same
```

```
                functions
                 as the server.
The patches must be removed in reverse order, so you must check what
program might have installed the patches. If this happens always when
you try to quit Executive, then you should change the order of
the programs you run in s:startup-sequence and s:user-startup. This
requires some knowledge, so don't touch these files if you aren't sure
what you are doing.

Another way to solve the problem is to use a program called SetManager
by Nicola Salmoria.

You might also get this message while trying to quit the server:

  Unable to quit. Some clients are still running.

You must quit all clients before quitting the server. You might have
left
                top
                 or
                ALoad
                 running.
```

1.21 Preferences file

```
                PREFERENCES FILE
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

The preferences file is called 'Executive.prefs'. It's searched from the
following directories in this order:

  current directory
  PROGDIR: (directory where the server binary is)
  ENV:
  S:

This is an ASCII file and contains one option on each line. Blank lines
and lines starting with #-character are ignored. The option name and
the value must be separated by spaces or tabs. Option names are case
insensitive.

These options work like the CLI arguments and Workbench tooltypes, so
consult their
                documentation
                .

  CATCHMAX
  CATCHMIN
  DYNAMICMAX
  DYNAMICMIN
  NOFOCUS
  SCHEDWB
  TIMER
  SCHEDULER
```

```
These options are used only in the preferences file:

  TASK
  CHILDTASKS
  IGNORE
  BASEDIR

TASK

  Template:  TASK <task name> <NOSCHEDULE>  [priority]
                                            [BELOW]
                                            [ABOVE]
                              <SCHEDULE>    [nice-value]

  This tells the server to watch for tasks with the given name. The
  name is case insensitive and * can be used as a wildcard.

  When a task matching the name is found, it's either NOT SCHEDULED
  or SCHEDULED. If you want the task NOT to be scheduled, you can
  optionally tell the server to keep the tasks priority at the given
  value, or BELOW or ABOVE the dynamic range.

  If the task is to be scheduled, you can give a default nice-value
  for it. Otherwise task will inherit its parent's nice-value.

CHILDTASKS

  Template:  CHILDTASKS <task name> <NOSCHEDULE>  [priority]
                                                  [BELOW]
                                                  [ABOVE]
                                    <SCHEDULE>    [nice-value]

  Similar to TASKS option, but applies to all childtasks created by
  the named task.

IGNORE

  Template:  IGNORE <task name>

  Tell the server to totally ignore the given task. Wildcards are supported
  and the name is case insensitive.

  IMPORTANT! The <task name> is the actual task name, not the name of
  a CLI command. If task must be ignored, the server must do it at the
  task creation time and the CLI command name is not yet available.

  This is needed only when a task is not removed with RemTask(). This
  is EXTREMELY rare and, illegal.

BASEDIR

  Template:  BASEDIR <directory>

  This option is generated by the installation program. It's used when
  when displaying on-line help so don't change it or delete it.
```

```
When you save the preferences file from
                ExecutivePrefs
                 you'll lose the comments
you have in the preferences file.

Here's an example preferences file:

#### install directory (please don't delete this) ####
BASEDIR   "SYS:Executive"

#### catch- and dynamic ranges ####
CATCHMAX  2
CATCHMIN  -105
DYNAMICMAX  -50
DYNAMICMIN  -100

#### options ####
#NOFOCUS
#SCHEDWB
SCHEDULER REMEMBER

#### tasks ####
TASK    top                             SCHEDULE  -15
CHILDTASKS  ASwarm                          NOSCHEDULE  BELOW
TASK    CygnusEd                        SCHEDULE  -20
TASK    HyperCacheII                    NOSCHEDULE  ABOVE
```

1.22 Server Internals

```
                SERVER INTERNALS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

SCHEDULING

Executive schedules tasks by recalculating their priorities. This is
done once a second. Priorities are calculated only if the task has recently
used CPU time.

PID

PID means Process IDentifier. Every task has a unique PID, allocated
by the server. If task is a CLI, the PID will be the CLI number.
Otherwise a unique number from 200 upwards is given to the task.

PIDs are very useful when you need to change a nice-value or priority
of some task. You don't have to type in the name and sometimes there might
be many tasks with the same name.
```

NICE-VALUE

Each task has its own nice-value, usually 0. Negative nice-values (up to -20) give more CPU time to a task, i.e. it will be less nice to other tasks. Positive nice-values (upto +20) give less CPU time to a task. If you have two tasks that want to use all CPU time they get, and they have nice-values -20 and +20, the task with the +20 nice-value will still get some CPU time.

It's not possible to give any extract numbers of how much different nice-values have effect on task's priority. Each scheduler uses nice-values in somewhat different way and many other values affect the calculated priority.

LOAD AVERAGE

Executive maintains three load averages, for the past 1, 5 and 15 minutes. A load average is the number of tasks that have been ready to run or running in the past 1, 5 or 15 minutes. If the load average is 1.0, you have had exactly one task running.

WHAT TASKS SHOULD/SHOULDN'T BE SCHEDULED

There are very few tasks that shouldn't be scheduled, for example input.device and telecommunication programs. But usually you don't want to schedule any tasks that normally have a priority 4 or above.

If you have a screenblanker that draws some fancy graphics on the screen while it blanks the screen, it's better not to schedule it. You should lower its priority below the catch range, so it doesn't consume any valuable CPU time.

FOCUS

Usually the task that has opened the currently active window is the one that receives user attention. Executive will give a little more CPU time to this task if you haven't turned the focus-option off. The exact amount varies, depending on the scheduler you have chosen.

When you start the server, it will scan opened windows trying to figure out their owner, but it's not always possible, so it's best to start Executive before any windows have been opened. You can see the number of windows whose owner is know by using the

```
stat
client.
```

CHILD-PARENT

Executive maintains information about each task's parent and its children. It's not possible know this relationship for tasks that were in the system when the server was started.

If a parent of some task terminates, its children will be transformed to

the parent of the terminated task.

PERFORMANCE

The server uses very little CPU time. Top and ps show how many percentages of CPU time the server actually uses. Some of this time goes to serving clients. If you start 10 ALoad clients, you can see a small increase in server's CPU usage.

As a technical detail, Executive uses hash-tables to look up the internal information structure for each task, so there is no need to traverse long task lists.

So all in all, the cost of using Executive is insignificant. You'll easily spend more time changing priorities than Executive uses in a few days.

REAL PRIORITIES

Executive keeps track of the real priorities of all tasks so it can restore them when you quit the server. The real priority is the one that is set by SetTaskPri() call.

STRANGE PRIORITIES

Exec.library lacks a function GetTaskPri(), which could be patched so the real priority of the task could be returned. Now it's possible that some task reads its 'scheduling' priority and starts a childtask with the this priority. The server will notice this and replace the priority with correct value. This must be done, because if you will quit the server, the childtask's priority would be incorrect.

Sometimes a childtask is started with parent priority - 1 (for example), and then the server can't correct this. This is not a problem, but if you quit the server, the task's priority will be incorrect, usually some negative value in dynamic range.

CONTEXT SWITCHES

Executive keeps track of the number of context switches for each task. These are divided to voluntary and involuntary context switches. Voluntary context switch happens when a task calls the Wait()-function and is put to sleep. Involuntary context switch happens when a task is forced to give the CPU to another task.

TIMERS

Executive needs to be signalled by a timer every second so it can recalculate priorities. Amiga has a device called 'timer.device' which can be used to get accurate timing signals. There's just one problem: timer.device may cause characters to be lost during serial transfer Because the serial interface in Amiga is not

buffered. There are two kinds of hardware timers in Amiga, CIA-A
and CIA-B. Timer.device uses CIA-B. When a certain time has elapsed,
the CIA timer causes an interrupt. CIA-B has higher level interrupts
than the serial interface, so it's served first. If the serial interface
interrupt can't be served in time, a character is lost. CIA-A uses
a lower level interrupt than CIA-B and the serial interface.

Executive tries first to use CIA-A timer. If no timer is available,
it tries CIA-B. If that fails, Executive uses timer.device.

If you want to use CIA-B timer or timer.device, see the TIMER-option.
If you don't have problems with serial transfers, you may want to
use CIA-B because then CIA-A timer will be left for other programs.
For example, ShapeShifter wants to use CIA-A timer, so use CIA-B or
timer.device for Executive.

To see what timer Executive is using, use the
                stat
                -client.

IS IT A HACK?

No, Executive is not a hack. The only 'illegal' thing that must be
done is to patch the undocumented Switch()-function in exec.library
and to install a routine to ExecBase->ex_LaunchPoint. These are needed
to get accurate CPU usage for tasks and it's the best way to do it.
There's no way to get more accurate CPU usage calculation on AmigaDos.

HOW THE CPU USAGE FOR A TASK IS MEASURED?

The CPU usage calculation starts when a task is launched by the dispatcher
and it's stopped just before the task is switched to another. The task time
doesn't include the time that is spent in exec.library for saving the
task's registers and finding a new task to run during a context switch.
That's why the
                top
                 client rarely shows 100% CPU usage. If it's 99.7%,
then the 0.3% is spent in the task dispatcher doing 'unproductive' work.

1.23 Clients

                CLIENTS
~~~~~~

Clients are utility-programs that are used together with the Executive
server. Most of the clients require the server to be running to work.

Here is a quick overview of included clients:

                acct
                            accounting daemon
~~~~~~

```
ALoad
           display load average

ALoad3D
         display load averages in 3D

Commander
       general task manager

ctp
             extended ChangeTaskPri

kill
            extended Break

lastcomm
        list last commands executed

nice
            run programs with lower scheduling priority

ps
              process status displayer

pstree
          display child-parent relationships

renice
          renice a task

sa
              print accounting statistics

stat
            display some misc. information

timer
           time CLI and Workbench programs

top
             display information about the top CPU tasks

uptime
          display system uptime and load averages
```

All clients can be run from CLI and Workbench. Most of the options can be given as CLI arguments or Workbench tooltypes.

You can always use the HELP option or a tooltype with the same name with all clients and get to their help-page.

Each client has an option called VERSION, which can only be given from CLI. It prints out the clients version number.

When you run a program from Workbench, the program opens a window for it's output if necessary. The default size for this window is 640x200

```
pixels, but it can be changed with an environmental variable
EXECUTIVEWINDOW. For example, if you have a PAL machine, you want a
window which is 256 pixels high. You can set the environmental variable
to the desired size with these CLI commands:

  setenv EXECUTIVEWINDOW "0/0/640/256"
  copy ENV:EXECUTIVEWINDOW ENVARC:

The format of the environmental variable is left/top/width/height.

CLI ARGUMENTS

When a client is invoked with a question mark as an argument, it
will output the argument template. For example, the command "ps ?"
will output this:

  F=FORMAT,S=SORT/K,LIST/S,NH=NOHEADER/S,PH=PADHEX/S,PLAIN/S,DELAY/N/K,
  IV=INVERSE/S,ACTIVE/S,IDLE/S,SCHED=SCHEDULED/S,RUN/S,READY/S,WAIT/S,
  ALL/S,OWN/S,P=PID/K,U=USER/K,G=GROUP/K,N=NAME/K,R=PGRP/K,PRIGT/N/K,
  PRILT/N/K,PRIEQ/N/K,NPROCS/N/K,EVERYTHING/S,BABY/S,TASK/S,PROCESS/S,
  CLI/S,CPU/S,HELP/S,VERSION/S:

A CLI argument is divided in three parts:

  NH=NOHEADER/S
  ^^ ^^^^^^^^ ^
  |  |        |
  |  |        `-- modifier
  |  `-- option name
  `-- can be used instead of the full name

The modifiers used in Executive are:

  /S - Switch. For example, "ps SCHEDULED" will output only the scheduled
       tasks.

  /N - A decimal number.

  /K - Keyword. This means that the option will not be understood unless
       the option name appears. For example if the template is "PGRP/K",
       then unless "PGRP=<pgpr>" or "PGRP <pgrp>" appears in the command
       line, PGRP will not be accepted.

  /A - Required. This keyword must be given a value during command-line
       processing, or an error is returned.

  /F - Rest of line. If this is specified, the entire rest of the line
       is taken as the parameter for the option, even if other option
       keywords appear in it.

If there are no modifiers after the option name, it's an string argument
which can be specified without the option name. So you can invoke ps with
a format string in three ways:

  ps FORMAT=pid,cpu%,name
  ps F=pid,cpu%,name
```

```
  ps pid,cpu%,name
```

1.24 Schedulers

```
                SCHEDULER
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

Scheduler is a mathematical algorithm that calculates priorities for scheduled tasks. Schedulers use different kinds of information when calculating priorities:

- load average
- task's recent CPU usage
- task's context switchces

Let me first say that there's no need to use a scheduler on Executive, but you'll probably want to use one of the 6 different schedulers available. All schedulers on Executive are fair-share schedulers, they'll make sure that each task gets a chance to run, but favour tasks that only use a little CPU time, i.e. keep compute-bound tasks at low priority and transput-bound tasks at high priority. If the

```
                focus-option
```

has been turned on, the task that owns (i.e. has opened) the currently activate window gets a higher priority. Also, task's nice-value affects the priority calculation.

If you aren't using a scheduler, then the priorities won't be changed by the server, but you can still use all features of Executive normally.

Schedulers work by calculating task priorities for scheduled tasks once a second. If a scheduler notices that a task hasn't used CPU time recently, it will stop calculating that task's priority.

When a new task is added, it will be given some of its parent's scheduling information (e.g. recent CPU usage) and when a task exits, some of its scheduling information is transferred back to the parent. This is especially useful when a task does most of its hard work in subtasks that it created (AdPro for example uses subtasks for loading and saving images and when processing them).

To see how the system behaves under different schedulers use the

```
                ps
```

and

```
                top
```

clients and look how much CPU time different kinds of tasks get.

There are currently six different schedulers available:

- simple
- standard
- remember

```
  * market
  * queues
  * super

See the
                server options
                 documentation for information about changing
the scheduler. Please note that it's not possible to change the scheduler
on the fly, you must restart the server.

I'll now outline some of the main differences between the schedulers:

  SIMPLE

    As the name says, this is the simplest of all the schedulers.
    The calculated priority for a task is proportional to the task's
    recent (past 5 seconds) CPU usage. This scheduler is useful in
    very lightly loaded systems. Actually, load average 2.0 is used
    constantly.

  STANDARD

    This scheduler can handle much higher loads than the simple-scheduler.
    It's similar to the simple-scheduler except that it also considers the
    load average when calculating priorities. When the past minute load
    average gets higher, used CPU time will 'cost' much more.

  REMEMBER

    This is a 'heavy-duty' scheduler, it can handle very highly loaded
    systems. It's similar to the standard scheduler, but it will remember
    a lot longer when a task uses much CPU time and it will forget
    small CPU usage very quickly.

  MARKET

    This scheduler is based on 'bidding' for CPU time. Each task gets
    some new money from the scheduler every second. Used CPU time will
    cost money, and the task that has most money gets the first chance to
    run, i.e. the highest priority. When the system load average is higher,
    CPU time will cost much more.

  QUEUES

    This scheduler divides the dynamic range to a few priority levels and
    runs many tasks with the same priority. Exec will then Round-Robin
    these tasks. This might be handy in multiuser systems. Experiment!

  SUPER

    This is similar to the standard-scheduler, but it also uses the

                context switch counters
                 when calculating priority for a task.
    Tasks that use a lot of CPU time must usually be forced off the CPU
    involuntarily, these will be given lower priority than to tasks that
    voluntarily give the CPU to another task. The result is that transput-
```

```
    bound tasks get more CPU time than compute-bound tasks.

In some cases even the SUPER scheduler can't handle the load because
a lot of small tasks are created for a very short time. The best thing
you can do is to renice the whole process group to +20. This kind of
situation is pretty rare so don't worry. When I do some version management
for Executive sources, I run a program called Make recursively
for many subdirectories and
                pstree
                 outputs something like this:

    +---[Make]
        +---CON
        +---[top]
        `---[sh]
            `---[sh]
                `---[Make]
                    `---[sh]
                        `---[sh]
                            `---[Make]
                                `---[sh]
                                    `---[Make]
                                        `---[Make]

The Make at the end is usually run for less than one second so sometimes
a priority can't be calculated for it before it exits.
```

1.25 Accounting

```
                ACCOUNTING
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

When accounting has been enabled, the server will create an accounting
record every time a program started from CLI or Workbench terminates.
The accounting record consists of this information:

  Command name
  Time the command terminated
  Used CPU time
  Elapsed time
  User ID  (if MultiUser has been installed)
  Group ID (if MultiUser has been installed)
  Miscellaneous flags

When enough accounting records have been created, or the oldest record
has been in memory for a user specified time, the server signals
                acct
                -
client and tells it to write the accounting records to disk.

Acct-client writes accounting records to a file called `acct'. To see the
last terminated commands, you use the
                lastcomm
```

```
                -client.
The most recently terminated command is displayed first.

Because the 'acct'-file may grow rather large in a short time, it's
necessary to condense this information in to a much shorter format and
that is done by the
                sa
                -client. Sa stands for summarize accounting.

Sa reads the acct-file and generates a summary which it writes to files
called 'acct.procsum' and 'acct.usersum' which contain statistics
according to command name and user ID, respectively. If these files
already exist then they are read and included in the summary.
This information is included in the summary files:

  Command name (acct.procsum) or user ID (acct.usersum)
  Number of times the command has been executed (acct.procsum) or
    Number of commands the user has executed (acct.usersum)
  Total used CPU time
  Total elapsed time

If MultiUser hasn't been installed, 'acct.usersum' will contain only one
user.

Normally sa will just print the summary and not write it back to disk.
To write the summary to disk, you must use the MERGE-option with sa.

Accounting records can't be created for any custom shell's (CSH, SkSH)
internal commands, but I'm working on a solution for this problem.
```

1.26 Genies

```
                GENIES
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Genies are project icons that execute a client with some tooltypes. You can
find them in the Genies-drawer. If you want to create your own Genie, just
make a copy of one of the Genie-icons and change the default tool and
tooltypes. For example, if you want to make a Genie for 'pstree', set
the default tool to '/pstree'.

USING NICE FROM WORKBENCH

You can run programs with a different nice-value by creating a Genie
for the program you want to run. Use
                /nice
                 as a default tool for the
project icon and put the name of the program you want to run to a tooltype
COMMAND, for example:

  COMMAND=c:VirusChecker DH0:
```

```
AVAILABLE GENIES

Here are the available Genies and their equivalent CLI commands:

Scheduled tasks

  CLI:
                ps
                 SCHEDULED

  Display scheduled tasks.

Merge accounting

  CLI:
                sa
                 MERGE

  Summarize
                accounting
                 and merge it with the (existing) summary database.
  The current accounting file will be delete. The summary is printed to
  screen.

User accounting

  CLI:
                sa
                 USER

  Display per-user accounting summary. If you're not using MultiUser,
  this will just display all commands grouped together.
```

1.27 Glossary

```
GLOSSARY
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

blocked

  A task that is ready but not running is blocked.

compute-bound

  A task that spends most of its time just using the CPU without waiting
  for any external events is compute-bound. Opposite of transput-bound.

context switch

  A context switch happens when the running task is switched to another.
```

```
Exec

  Did you know that the full name of Exec is really The Multitasking
  Executive?

MultiUser

  From the README-file included with MultiUser distribution:

  MultiUser allows you to create a *IX-like environment where several users
  live together in harmony, unable to delete each others files, unable to
  read those private love-letters of other users. And this even if
  several users are working on the machine at the same time (on a terminal
  hooked up to the serial port)

  People without a valid login ID and password won't be able to access
  files you have made private with MultiUser.  If you make all files
  private (not readable for others), the only useful thing they could do,
  is boot from a floppy.

  You can get MultiUser from any Aminet site, see the util/misc-directory.

process

  A process on Amiga is an extension of a task. The main difference is
  that only a process can use DOS to access files.

Round-Robin

  The way the OS shares CPU time between tasks with same priority.

task

  On other operating systems than AmigaDos tasks are called processes, but
  on Amiga process has a special meaning.

transput-bound

  A task is transput-bound if it spends most of its time waiting for
  some event to occur. Opposite of compute-bound.
```

1.28 Registration

```
                REGISTRATION
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

UNREGISTERED VERSION OF EXECUTIVE

These features require a registered version of Executive:

  * All schedulers except STANDARD
  * Accounting
  * ALoad3D

The absence of these features doesn't make Executive unusable. You can
```

use Executive without these features but I hope you'd register after you have seen what this program is.

WHAT DO I GET WHEN I REGISTER?

You'll receive a keyfile which enables the disabled features. You'll also ensure that all updates will be FREE for you. Currently I'm planning to distribute updates free of charge, but this may change in the future. Updates will always be free for registered users. Some new clients that I'm planning to add, will be available for registered users only.

ORDERING

The easiest way to fill in a registration form is to use the "Register" program, which asks you all the necessary information and creates an ASCII registration form. A blank registration form is available in these formats:

- FinalWriter
- PostScript
- DVI
- IFF
- ASCII

You'll find these files in the Register-directory.

If you don't have a printer, then create an ASCII registration form with the "Register" program and copy the necessary information to a blank paper.

When you have filled in the registration form, please send it to me with your payment. My address is:

Petri Nordlund
Vanhamaantie 4
28800 PORI
FINLAND

REGISTRATION FEE

Registration fee is accepted in these currencies:

15	USD	(US dollar)
10	GBP	(Pound sterling)
70	FIM	(Finnish mark)
20	DEM	(Deutsche mark)
100	NOK	(Norwegian krone)
120	SEK	(Swedish krona)
500	BEF	(Belgian franc)
70	FRF	(French franc)
25	NLG	(Dutch guilder)

PAYMENT METHODS

Cash	This is the preferred payment method and also the cheapest for you and me. Make absolutely sure that the bills/notes are disguised. Enclose the cash in two pieces of non-white paper to disguise it. Please DON'T SEND COINS, they cannot be exchanged at the local bank.
Eurocheque	Write the cheque for 70 FIM, that is, 70 Finnish marks. You must write your card number on the back of the cheque, otherwise I can't cash it.

This payment method is available for Finnish users only:

Postiennakko	Postiennakkomaksu 25 mk lisätään hintaan (70+25=95 mk).

METHOD OF DELIVERY

If you have an Internet email address, I'll email you the keyfile on the same day I receive your registration. Otherwise I'll send you a 3.5" disk by post with the keyfile and the latest version of Executive.

The latest version of Executive can always be downloaded from Aminet. To find out what is the latest version, see the Executive WWW-page:

http://www.megabaud.fi/~petrin/Executive.html

Fidonet is too insecure for transmitting the keyfile.

1.29 Keyfile

KEYFILE
~~~~~~~

The keyfile contains your name, your address and a serial number. It's strictly forbidden to give this keyfile to anyone. Several digital fingerprints are included in this file and redistributed copies are easy to identify.

When the Executive server is started, it will search for the keyfile from these directories:

current directory
PROGDIR: (directory where the server binary is)
ENV:
S:

If you want to put the keyfile to a encrypted partition or just somewhere else than in these directories, put the directory name to environmental variable "KEYPATH".
~~~~~~~

1.30 Author

```
                AUTHOR
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Executive has been a large project and I have sometimes lacked motivation
to continue with its development, considering the uncertain future of
Amiga, but things look much better now.

It's always nice to hear comments and suggestions about this program, as
those have already given me a lot of motivation and driven the project
further.

I intend to continue development and release new versions regularly, so
your thoughts and ideas are always welcome. Please tell me what you'd like
to see implemented in Executive and what could be done better.

My Amiga is an old Amiga 2000, equipped with GVP G-Force 030/25 turbo,
a 340MB and 40MB harddrives and 10MB of memory. I also have a Citizen
120D printer and SupraFAX V.32bis modem.

You can contact me in several ways:

1.32 History

```
HISTORY
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

V1.00 First public release.
```

1.33 acct

```
                ACCT
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Accounting daemon.

                OPTIONS
                DESCRIPTION

  Acct writes
                accounting
                 records to disk. The server will create
  an accounting record every time a program started from CLI or Workbench
  terminates.

  To reduce disk access acct purges records to disk only when a certain
  number of them has been created or when the oldest record has been
  in memory for a specified time. Acct doesn't use any CPU time when
  it's waiting.

  The easiest way to start acct is to copy it to your WBStartup-drawer.
```

```
  The acct-clients icon should include the DONOTWAIT-tooltype, which
  tells Workbench not to wait for acct to exit before proceeding.

  It's not necessary to put acct to WBStartup-drawer, you can still
  start it anytime you want to, from Workbench or from CLI. If you
  start it from CLI, you have to run it:

    run <NIL: >NIL: acct

  The default accounting file is 's:acct', but you may change this.
  Use the ACCTFILE-option to do this or set the environmental variable
  ACCTFILE to contain the file name.

  If the disk where accounting records are being written becomes full,
  accounting records might be lost. Accounting is won't be disabled
  so you can make more room to the disk and acct will continue normally.

  If acct notices an unprintable character in the command name, it
  will be changed to '?' to prevent cluttered display.

  To turn accounting off, send a break-signal to the accounting daemon
  or use the command:

    acct off

  If you're using Workbench, start the acct-client again and it will ask
  you if you want to turn accounting off.

  Acct works by patching the dos.library RunCommand() function. If you
  run another program that patches this function, it's not possible
  to quit acct before the patch is removed. This is not very likely
  so you don't have to worry about it. A more common problem when
  quitting acct is that some commands are still being executed and
  they have called the RunCommand() function, so it's not possible
  to safely remove the patch. If the patch can't be removed, acct
  will notify you about this. Accounting will be disabled and acct
  stays in memory waiting until the patch can be removed. You don't
  have to worry about this, you can safely start acct again if
  necessary.

EXAMPLES

  Start accounting and output all records to screen instead of writing
  them to disk. Use CTRL-C to stop.

  acct STDOUT
```

1.34 acct options

```
                ACCT OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

ACCTFILE
```

```
  Template:  F=ACCTFILE
  Tooltype:  FILE
  Default:   s:acct

  The accounting file.

OFF

  Template:  OFF/S
  Tooltype:  OFF

  Turn accounting off.

SECONDS

  Template:  S=SECONDS/N/K
  Tooltype:  SECONDS
  Default:   30

  Number of seconds to wait before writing records to disk. You can
  set this to 0, but then the disk must be accessed every time a command
  terminates and this may not be a good idea if you don't have a disk
  cache.

RECORDS

  Template:  R=RECORDS/N/K
  Tooltype:  RECORDS
  Default:   10

  The maximum number of accounting records in memory at once. When this
  limit is reached, records will be written to disk.

STDOUT

  Template:  STDOUT/S
  Tooltype:  STDOUT

  Instead of writing records to disk, print them to screen. This will also
  turn the COOKED-option on. See
               lastcomm
                for the output format.

COOKED

  Template:  C=COOKED/S
  Tooltype:  COOKED

  Write accounting records in human-readable form, not in binary. If you
  write records to disk in this format, you can't use
               lastcomm
                or
               sa
                 to manipulate them. See
               lastcomm
                for the output format.
```

```
PURGE

  Template:  PURGE/S
  Tooltype:  PURGE

  Force acct to write all records currently in memory to disk.

HELP

  Template:  HELP/S
  Tooltype:  HELP

  Display this text.

VERSION

  Template:  VERSION/S
  Tooltype:  -

  Display version number.
```

1.35 ALoad

```
                ALOAD
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  ALoad displays a periodically updating histogram of the
  system load average.

                OPTIONS
                DESCRIPTION

  Two versions of ALoad are provided, one that supports MUI and
  a GadTools-version for all Amigas. They are identical except where
  otherwise said.

  ALoad opens a small window and displays a periodically updating
  histogram of the system load average over last minute. When the
  load average reaches 1.0, the window is divided in two with a line
  through the middle. This line represents load average 1.0, the top
  of the window represent load average 1.99999... When load average
  reaches 2.0, the window will be divided in three parts.

  The graph is scrolled to left when it reaches the right border. You can
  resize the window without losing the old histogram, which will be
  redrawn to the new window.

  There are several menu items available:

  Project->New will redraw the histogram.
```

```
  Settings->Update sets the update rate in seconds.

  Settings->Scroll sets the amount that the histogram is scrolled when
  it reaches the right edge. 1/2 means that the histogram will be scrolled
  half the width of the current window.

  Settings->Scale sets the MINIMUM scale of the histogram, i.e. the
  minimum number of divisions in the scale.

  Settings->Stay front makes the window stay in front of all other
  windows.

EXAMPLES

  ALoad

  Scroll 10 pixels, update every 30 seconds, don't display the size-gadget:

  ALoad SCROLL=10 UPDATE=30 NOSIZEGADGET
```

1.36 ALoad options

```
ALOAD OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

SCROLL

  Template:  SCR=SCROLL/N/K
  Tooltype:  SCROLL
  Default:   1

  The number of pixels to shift the graph to the left when the graph
  reaches the right edge of the window. If you specify value 0 here,
  it means that the histogram will be scrolled half the width of the
  current window.

UPDATE

  Template:  UD=UPDATE/N/K
  Tooltype:  UPDATE
  Default:   1

  The update interval in seconds.

SCALE

  Template:  SCA=SCALE/N/K
  Tooltype:  SCALE
  Default:   1

  The minimum number of tick marks in the histogram, where one division
  represents one load average point. If the load goes above this number,
  ALoad will create more divisions, but it will never use fewer than this
```

number.

LABEL

Template: LB=LABEL/K
Tooltype: LABEL

The text in the window's title-bar. You can put here whatever you like.

NOSIZEGADGET

Template: NSG=NOSIZEGADGET/S
Tooltype: NOSIZEGADGET

Don't display a size-gadget in the window.

STAYFRONT

Template: SF=STAYFRONT/S
Tooltype: STAYFRONT

Keep the window in front of all other windows.

LEFT

Template: LEFT/N/K
Tooltype: LEFT
Default: 0

Offset of the left edge of the window relative to screen.
This option is not implemented in the MUI-version of ALoad.

TOP

Template: TOP/N/K
Tooltype: TOP
Default: 0

Offset of the top edge of the window relative to screen.
This option is not implemented in the MUI-version of ALoad.

WIDTH

Template: WIDTH/N/K
Tooltype: WIDTH
Default: Calculated from display width

Width of the ALoad window.
This option is not implemented in the MUI-version of ALoad.

HEIGHT

Template: HEIGHT/N/K
Tooltype: HEIGHT
Default: Calculated from display height

```
  Height of the ALoad window.
  This option is not implemented in the MUI-version of ALoad.

PUBSCREEN

  Template:  PS=PUBSCREEN/K
  Tooltype:  PUBSCREEN
  Default:   Workbench

  Name of the public screen where the window is to be opened.
  This option is not implemented in the MUI-version of ALoad.

HELP

  Template:  HELP/S
  Tooltype:  HELP

  Display this text.

VERSION

  Template:  VERSION/S
  Tooltype:  -

  Display version number.
```

1.37 ALoad3D

```
                ALOAD3D
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  ALoad3D displays a periodically updating 3D bar-chart of
  system load averages.

                OPTIONS
                DESCRIPTION

  ALoad3D opens a small window and displays a periodically updating three
  dimensional bar-chart of the system load averages over last minute,
  last 5 minutes and last 15 minutes.

  The maximum displayed load average is 5.0. If a load average is higher
  than this, then a small 'pyramid' is generated on top of the bar. Server
  recalculates load averages once a second.

  There are several menu items available:

  Settings->Delay between updates sets the delay in 1/50 seconds
  between display updates.

  Settings->Speed sets the rotate speed.

  Settings->Motion->None stops the rotation.
```

```
  Settings->Motion->Rotate rotates the bar-chart.
  Settings->Motion->Wiggle makes the bar-chart rotate from left to right
                           and then from right to left.

  Settings->Stay front makes the window stay in front of all other
  windows.

  ALoad3D requires a registered version of Executive.

EXAMPLES

  ALoad3D
```

1.38 ALoad3D options

```
ALOAD3D OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

DELAY

  Template:  D=DELAY/N/K
  Tooltype:  DELAY
  Default:   3

  Delay between display updates in 1/50 seconds. Maximum delay is 50
  (one second). If the delay is 0, display will be constantly updated.

SPEED

  Template:  S=SPEED/N/K
  Tooltype:  SPEED
  Default:   3

  The rotation speed, maximum is 10.

NOMOTION

  Template:  NM=NOMOTION/S
  Tooltype:  NOMOTION

  Don't rotate the bar-chart.

WIGGLE

  Template:  WG=WIGGLE/S
  Tooltype:  WIGGLE

  Makes the bar-chart rotate from left to right and then from right to
  left.

LABEL
```

```
  Template:  LB=LABEL/K
  Tooltype:  LABEL

  The text in the window's title-bar. You can put here whatever you
  like.

NOSIZEGADGET

  Template:  NSG=NOSIZEGADGET/S
  Tooltype:  NOSIZEGADGET

  Don't display a size-gadget in the window.

STAYFRONT

  Template:  SF=STAYFRONT/S
  Tooltype:  STAYFRONT

  Keep the window in front of all other windows.

LEFT

  Template:  LEFT/N/K
  Tooltype:  LEFT
  Default:   0

  Offset of the left edge of the window relative to screen.

TOP

  Template:  TOP/N/K
  Tooltype:  TOP
  Default:   0

  Offset of the top edge of the window relative to screen.

WIDTH

  Template:  WIDTH/N/K
  Tooltype:  WIDTH
  Default:   Calculated from display width

  Width of the ALoad3D window.

HEIGHT

  Template:  HEIGHT/N/K
  Tooltype:  HEIGHT
  Default:   Calculated from display height

  Height of the ALoad3D window.

PUBSCREEN

  Template:  PS=PUBSCREEN/K
  Tooltype:  PUBSCREEN
  Default:   Workbench
```

```
  Name of the public screen where the window is to be opened.

1.39 Commander

```
                COMMANDER
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  A general task-manager with GUI.

                OPTIONS
                DESCRIPTION

  Two versions of Commander are provided, one that supports MUI and
  a GadTools-version for all Amigas. They are identical except where
  otherwise said.

  Commander opens a window showing all tasks currently in system. The
  display looks like this:

  NAME                  PID TYPE PRI RPRI NICE
  [CyberCron]             4 bcli -70    0    0
  console.device        208 task   5    5    0
  DH0                   247 proc -63    1  -20
  ramlib                209 proc -70    0    0
  ...

  After the task name and its PID the TYPE field shows if the task
  is a task or a process. PRI is the task's priority, RPRI is its
  real priority, the one that will be returned when the server quits.
  NICE is, obviously, task's nice-value.

  If the task name is in square brackets, it's a CLI command.

  BREAK

  The break-button lets you send a break-signal to the select task.
  You can choose from four different signals, usually you'll use the
  C signal, which is used to break a task. D-signal is used with shell
```

```
  scripts and F-signal is used with commodity-programs. F-signal is
  currently undefined. Note that Commander only sends the break-signal
  to a task, it can't guarantee that the task will actually exit.

  NICE

  This lets you modify tasks nice-value. Higher values make the task
  'nicer', i.e. it will be given less CPU time. Negative values will
  do the opposite.

  SIGNAL

  Each task can receive 32 different signals. If you don't know
  anything about signals, press the cancel-button and don't try to
  signal a task, it will probably crash your machine.

  All the 32 signals are shown in the window. You can choose any number
  of signals you want to send. If a signal is shown in white, it means
  that the task is currently waiting for this signal. If the signal
  has been ghosted, it's not allocated and sending it has no effect.

  REMOVE

  Will remove the selected task from exec.library task-list by calling
  RemTask(). Task's resources won't be deallocated and a crash is very
  likely. Don't use this if you don't know exactly what you're doing.

  PRIORITY

  Set the priority of a task. If you change task's priority to catch range,
  scheduler will notice this and start scheduling the task.

  UPDATE

  Update the task list. The task list is not updated automatically, so
  it may include task's that have long since terminated.

  QUIT

  Obviously, quits Commander.

  The MUI version of Commander also displays a CPU usage of the selected
  task in a graph on top of the window. The default is to show recent
  CPU usage, but choose the Settings->MeterType->Current CPU usage
  menu item to show last second CPU usage.

EXAMPLES

  Commander
```

1.40 Commander options

```
COMMANDER OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

CURRENT

  Template:  C=CURRENT/S
  Tooltype:  CURRENT

  Instead of showing recent CPU usage, show current, last second CPU usage.
  This option is available only in the MUI-version of Commander.

LEFT

  Template:  LEFT/N/K
  Tooltype:  LEFT
  Default:   0

  Offset of the left edge of the window relative to screen.
  This option is not implemented in the MUI-version of Commander.

TOP

  Template:  TOP/N/K
  Tooltype:  TOP
  Default:   0

  Offset of top edge of the window relative to the screen.
  This option is not implemented in the MUI-version of Commander.

```

1.41 ctp

```
                CTP
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Change task's priority.

                OPTIONS
                DESCRIPTION
```

```
  Ctp is similar to the standard Amiga utility ChangeTaskPri, but it
  has a lot more options.

  Where ChangeTaskPri can only change the priority of a one task at a time,
  ctp can change multiple tasks priorities with one command. For example:

    ctp PRI=2 PID=10,20 NAME=DH\* USER=root GROUP=staff PGRP=273

  The following tasks will be affected by this command:

    - tasks with PID 10 and 20
    - tasks with name starting with 'DH' (case insensitive)
    - all tasks owned by the root user. (MultiUser only)
    - all tasks owned by the staff group. (MultiUser only)
    - all tasks that belong to process group 273.

  All these tasks get the specified priority, 2.

  If you don't specify any task, priority of the current task (usually
  a CLI process) will be changed.

  There's no need to use the PRI- and PID-keywords, ctp works without
  them too:

    ctp -10 278

  This will change the priority of the task with PID 278 to -10.

  You can replace c:ChangeTaskPri with ctp, they are compatible and ctp
  doesn't need the server to run. If the server isn't running you can
  use only PIDs that correspond to
                CLI numbers
                .

  When MultiUser is installed, only the super-user may raise task's
  priority. If you don't want to require root privileges for ctp, set
  the U-bit using MProtect.

EXAMPLES

  Change the priority of the current task to 0.

  ctp 0

  Change the priority of 'input.device' to 21.

  ctp 21 NAME=input.device
```

1.42 ctp options

```
CTP OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

```
PRIORITY

  Template:  PRI=PRIORITY/N/A
  Tooltype:  PRIORITY

  New priority for the specified tasks.

PID

  Template:  PID=PROCESS
  Tooltype:  PID
  Default:   Current task

  PIDs of the tasks whose priority is to be changed. You can list multiple
  PIDs here, separate them with a comma, for example 'PID=10,248,332'.

NAME

  Template:  N=NAME/K
  Tooltype:  NAME

  Names of the tasks whose priority is to be changed. You can list multiple
  names here, separate them with a comma, for example 'NAME=DH0,DH1,DH2,
  *.device'. You can use * as a wildcard.

USER

  Template:  U=USER/K
  Tooltype:  USER

  Names of the users whose all tasks will get the new priority. You can
  list multiple user names here, separate them with a comma, for example
  'USER=Frodo,Gandalf,Aragorn'. You can also use UIDs. This option isn't
  available if MultiUser hasn't been installed.

GROUP

  Template:  G=GROUP/K
  Tooltype:  GROUP

  Names of the groups whose all tasks will get the new priority. You can
  list multiple group names here, separate them with a comma, for example
  'NAME=staff,students'. You can also use GIDs. This option isn't available
  if MultiUser hasn't been installed.

PGRP

  Template:  R=PGRP/K
  Tooltype:  PGRP

  PGRPs of the process groups whose priority is to be changed. All tasks
  in the process group will be affected. You can list multiple PGRPs here,
  separate them with a comma, for example 'PGRP=254,298,578'.

1.43 ExecutivePrefs

```
                EXECUTIVEPREFS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Change server preferences.

                OPTIONS
                DESCRIPTION

  Two versions of ExecutivePrefs are provided, one that supports MUI
  and a GadTools-version for all Amigas. They are identical except where
  otherwise said.

  ExecutivePrefs searches the preferences file from these directories,
  in this order:

    current directory
    PROGDIR: (directory where the ExecutivePrefs binary is)
    ENV:
    S:

  If the file can't be loaded, default settings are used.

  The Save-button saves the preferences back to the file that was loaded,
  or to `s:Executive.prefs'-file if no preferences file was loaded.
  The changes don't take effect before the server is restarted.

  The Save/Restart-button saves the preferences file and restarts the
  server. You'll lose information about window owners and task
  relationships if you restart the server.

  ExecutivePrefs is divided in to four sections:

    Tasks
    Options
    Ranges
    Scheduler

  The Tasks-section lets you add a task to a list of watched tasks.
  A list of tasks currently being watched is displayed, it might
  look like this:
```

```
  WHICH       NAME           TYPE         PRIORITY    NICE
  TASK        top            SCHEDULE                  -15
  CHILDTASKS  ASwarm         NOSCHEDULE   BELOW
  IGNORE      BuggyProgram*
  ...
```

The WHICH-field is TASK, CHILDTASKS or IGNORE. TASK affects the named task only, CHILDTASKS doesn't affect the named task, but all its childtasks. If WHICH is IGNORE, then the named task will be ignored.

NAME is the task name. Ps, top and some other clients might display a task name in square brackets, which means that it's a CLI command. The brackets don't actually belong to the task name, so don't put the name in brackets here.

TASK and CHILDTASKS require that the TYPE is also specified. TYPE-field is either SCHEDULE or NOSCHEDULE. SCHEDULE forces a task to be scheduled, NOSCHEDULE tells the server NOT to schedule the task, even if its priority would be in the catch range.

PRIORITY is used only with NOSCHEDULE. If it's blank, nothing will be done to task's priority. If it's ABOVE, the priority will be kept above the catch range. BELOW will do the opposite. If it's a number, then the affected task(s) will be given this priority.

NICE is used only with SCHEDULE, it lets you set the default nice-value for a task.

See the
server documentation
for more information.

IMPORTANT! For Executive to catch a task, you must start it from CLI with the Run-command, or start it from Workbench. Because if you just execute the command in a CLI, no new task is created and Executive won't notice the command.

The New-button creates a new entry and opens the edit-window, which can also be opened by double-clicking a task, or pressing the Edit-button.

The Copy-button makes a copy of the selected task and the Delete-button deletes the selected task.

The Edit-window has got buttons to change all the above values. First you can change the name of the task, and as said earlier, * is allowed as a wildcard. By pressing the popup-button in the MUI version of ExecutivePrefs or the Name-button in the GadTools version, you can choose a name from a list of tasks currently in system.

The * MAGIC WAND * -button opens a list of preset entries for certain programs. When you select a task from this list, the settings will be adjusted and you can just press the Ok-button to confirm. Sometimes you might need to give a name to the task, when it's not specified in

```
  the 'magic wand entry'.

  I have included several screenblankers and communication programs to
  the magic wand -list, if you know other programs that could be here,
  please let me know.

  You'll also find an Magic Wand for ShapeShifter Mac emulator,
  it doesn't seem to work when it's subtasks' priorities are changed.
  Note that there really is a space between "ShapeShifter" and the
  asterisk.

  The explanation window reflects the state of the buttons below it.
  It will explain what will happen to the task. Try different settings
  and see how it changes.

  The Options-section is used to set a couple of miscellaneous
  options. The 'No focus on active window' disables the focus on active
  window. 'Schedule Workbench' will
                schedule Workbench
                 also.

  The Ranges-section lets you adjust the
                catch and dynamic ranges
                .
  ExecutivePrefs makes sure that you don't specify illegal values here.
  It permits you to set a high maximum priority for both ranges, but
  try to avoid setting the catch range maximum value over 4.

  The Scheduler-section lets you choose a
                scheduler
                .

  Remember that the changes you make don't affect the currently running
  server, you must restart it.

EXAMPLES

  ExecutivePrefs
```

1.44 ExecutivePrefs options

```
EXECUTIVEPREFS OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

FROM

  Template:  FROM
  Tooltype:  FROM

  Name and path of the preferences file if it isn't in any of the
  directories where ExecutivePrefs looks for it first.

LEFT
```

```
  Template:  LEFT/N/K
  Tooltype:  LEFT
  Default:   0

  Offset of the left edge of the window relative to screen.
  This option is not implemented in the MUI-version of ExecutivePrefs.

TOP

  Template:  TOP/N/K
  Tooltype:  TOP
  Default:   0

  Offset of the top edge of the window relative to screen.
  This option is not implemented in the MUI-version of ExecutivePrefs.

```

1.45 kill

```
                KILL
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Send a break-signal to task.

                OPTIONS
                DESCRIPTION

  Kill is similar to the standard Amiga utility Break, but it has a lot
  more options. Kill send a break signal to specified tasks but it's not
  guaranteed that these tasks will react to the signal.
```

```
  Where Break can only send break-signal to one task at a time, kill can
  handle several tasks with one command. For example:

    kill PID=10,20 NAME=DH\* USER=root GROUP=staff PGRP=273

  The following tasks will be affected by this command:

    - tasks with PID 10 and 20
    - tasks with name starting with 'DH' (case insensitive).
    - all tasks owned by the root user. (MultiUser only)
    - all tasks owned by the staff group. (MultiUser only)
    - all tasks that belong to process group 273.

  There's no need to use the PID-keyword, kill can be invoked without
  it too:

    kill 10

  This will send break-signal to task with PID 10.

  You can replace c:Break with kill, they are compatible and kill doesn't
  need the server to run. If the server isn't running you can use only PIDs
  that correspond to
                CLI numbers
                .

  You can't kill the server with kill, because kill connects to the server
  and it can't exit if it gets a break-signal because kill has connected
  to it.

  The PGRP-option is really useful when you want to kill a GNU C
  compilation. 'pstree SHOWPIDS' outputs:

    '---[Make] (9)
        +---CON (236)
        '---[sh] (1)
            '---[cpp] (10)

  You can send a break-signal to all these tasks with a single command:

    kill PGRP=9

  If MultiUserr has been installed, then root privileges are needed to
  kill other users' tasks. If you don't want to require root privileges
  for kill, set the U-bit using MProtect.

EXAMPLES

  Sorry, it's not possible to give any good examples of kill.
```

1.46 kill options

```
KILL OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

```
PID

  Template:  PID=PROCESS
  Tooltype:  PID

  PIDs of the tasks that will be killed. You can list multiple PIDs here,
  separate them with a comma, for example 'PID=10,248,332'.

NAME

  Template:  N=NAME/K
  Tooltype:  NAME

  Names of the tasks that will be killed. You can list multiple names
  here, separate them with a comma, for example 'NAME=DH0,DH1,DH2,Shell*'.
  You can use * as a wildcard.

USER

  Template:  U=USER/K
  Tooltype:  USER

  Names of the users whose all tasks will be killed. You can list
  multiple user names here, separate them with a comma, for example
  'USER=Frodo,Pippin,Gandalf'. You can also use UIDs. This option
  isn't available if MultiUser hasn't been installed.

GROUP

  Template:  G=GROUP/K
  Tooltype:  GROUP

  Names of the groups whose all tasks will be killed. You can list
  multiple group names here, separate them with a comma, for example
  'NAME=staff,students'. You can also use GIDs. This option isn't
  available if MultiUser hasn't been installed.

PGRP

  Template:  R=PGRP/K
  Tooltype:  PGRP

  PGRPs of the process groups whose all tasks will be killed. You can
  list multiple PGRPs here, separate them with a comma, for example
  'PGRP=254,298,578'.

C

  Template:  C/S
  Tooltype:  C

  Send the C-signal to the task(s). This is the default and most
  commonly used.

D
```

```
  Template:  D/S
  Tooltype:  D

  Send the D-signal to the task(s).

E

  Template:  E/S
  Tooltype:  E

  Send the E-signal to the task(s).

F

  Template:  F/S
  Tooltype:  F

  Send the F-signal to the task(s).

REMTASK

  Template:  REMTASK/S
  Tooltype:  REMTASK

  This will REMOVE the specified tasks from Exec task-lists with RemTask()
  call. This is EXTREMELY DANGEROUS and you can easily crash
  your machine if you don't know exactly what you are doing.

VERSION

  Template:  VERSION/S
  Tooltype:  -

  Display version number.
```

1.47 lastcomm

```
                LASTCOMM
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Show last commands executed in reverse order.

                OPTIONS
                DESCRIPTION

  Lastcomm gives information on previously executed commands. With no
```

```
  arguments, lastcomm prints information about all the commands recorded
  during the current accounting file's lifetime. The most recently
  terminated command will be printed first.

  Lastcomm will read from the default accounting file 's:acct', but
  you can use the ACCTFILE-option or the environmental variable ACCTFILE
  to change the name of the accounting file.

  The output looks like this:

    login                    -         --H   0.06s  14-Jun-95 00:04:17
    lzx                      root      S-H   0.55s  14-Jun-95 00:04:32
    lha                      -         --H  16.04s  14-Jun-95 00:04:07
    gzip                     -         --H   3.36s  14-Jun-95 00:03:53
    csh                      -         --H   0.12s  14-Jun-95 00:03:29
    endcli                   -         --H   0.00s  14-Jun-95 00:03:29
    date                     -         ---   0.01s  14-Jun-95 00:03:28
    stack                    -         ---   0.01s  14-Jun-95 00:03:28
    RX                       -         --H   0.03s  14-Jun-95 00:03:05
    sa                       -         --H   0.84s  14-Jun-95 00:03:04

  For each command, the following are printed:
  - command name
  - name of the user who executed the command (requires MultiUser)
    (If MultiUser hasn't been installed, the user name will be -)
  - flags:
      S -> command was executed by superuser
      W -> command was run from Workbench
      H -> command was scheduled
  - amount of CPU time used by the command (in seconds)
  - time the command terminated

  Lastcomm doesn't require that the server is running.

  Lastcomm asks the acct-daemon to write all unpurged records to disk
  so they will be included in the output.

  CTRL-C will stop the output.

EXAMPLES

  lastcomm
```

1.48 lastcomm options

```
LASTCOMM OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

ACCTFILE

  Template:  F=ACCTFILE
  Tooltype:  ACCTFILE
  Default:   s:acct
```

```
  The accounting file name.

PROCS

  Template:  C=COMMANDS/N/K
  Tooltype:  COMMANDS
  Default:   all

  How many commands to print.

NAME

  Template:  N=NAME/K
  Tooltype:  NAME

  Only commands matching this name should be printed. You can use * as a
  wildcard.

USER

  Template:  U=USER/K
  Tooltype:  USER

  Print commands executed by this user (name or UID). This option
  isn't available if MultiUser hasn't been installed.

```

1.49 nice

```
                NICE
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Execute a command with higher nice-value.

                OPTIONS
                DESCRIPTION

  Nice executes a command with a higher nice-value than the current
  task has. If no increment is given, 10 is assumed.
```

```
  Arguments can be given for the command as usual. If you're using
  a custom shell like csh or sksh, it's possible to run commands under
  that shell. Several clients use this feature, read about it from
               here
               .

  There are two ways to give the nice-value increment:

  With the NICE-keyword:

    nice NICE=10 <command>

  Or by preceding the value with a '-':

    nice -10 <command>     =>   nice NICE=10 <command>
    nice --10 <command>    =>   nice NICE=-10 <command>

  If the server isn't running, nice will still run the command, but
  the nice-value is ignored.

  Nice can also be used from Workbench, see
               Genies
                for more information.

  When MultiUser is installed, only the super-user may use negative
  nice-value increments. If you don't want to require root privileges
  for nice, set the U-bit using MProtect.

EXAMPLES

  Execute dir with nice-value of this task + 10.

  nice dir

  Execute dir with nice-value of this task + (-20).

  nice NICE=-20 dir
```

1.50 nice options

```
                NICE OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

NICE

  Template:  N=NICE/N/K
  Tooltype:  NICE
  Default:   1

  Run the command with this task's nice-value plus this increment.

SHELL
```

```
  Template:  S=SHELL/K
  Tooltype:  SHELL
  Default:   Run command under standard Amiga shell

  If you're using a custom shell, you can specify here a
                template
                 that is
  used when starting a command under that shell.

HELP

  Template:  HELP/S
  Tooltype:  HELP

  Display this text.

  Template:  VERSION/S
  Tooltype:  -

  Display version number.

COMMAND

  Template:  C=COMMAND/F
  Tooltype:  COMMAND

  The command to be executed and its arguments.
```

1.51 ps

```
                PSTREE
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Display information about tasks.

                OPTIONS
                DESCRIPTION

  Ps displays information about all or selected tasks in system. The
  output is sorted by PID.

  The ps output is controlled with keywords. Each keyword prints a piece
  of information about a task, for example:

    PID         task's PID
    NAME        task name
    TIME        total used cputime
    PRI         task's priority
```

```
And so on, over hundred keywords are currently known. Use the LIST-
keyword to get a full list of keywords available.

The default output consists of these keywords:

  PID,PRI,RPRI,NICE,TYPE,STATE,TIME,IDLE,CPU%,NAME

If you would like to display only task's pid, priority and name,
you would use this command:

  ps FORMAT=PID,PRI,NAME

Or just:

  ps PID,PRI,NAME

See the explanation of
              all available keywords
              .

If you want to align the header of a keyword to left, use < before
the keyword and > if you want to align it to right. Some keywords
are variable width and you can specify their width with /<width>
after the keyword. For example, this will change the width of
the NAME-field to 50 characters:

  ps PID,PRI,NAME/50

These options specify a built in format string:

  EVERYTHING      Output every keyword
  CPU             Output CPU usage values
  TASK            Output Exec's task-structure
  PROCESS         Output DOS-process structure
  CLI             Output CLI-process structure
  BABY            Output Executive internal task structure

For example,

  ps CPU

will display several CPU usage values.

You can sort the list by any of these keywords, or even using multiple
keywords. For example, if you want to sort by priority, use this command:

  ps SORT=PRI

If you want that tasks with the same priority are sorted by PID,
use this command:

  ps SORT=PID,PRI

To display the 15 tasks that have been idle for shortest time, you
need to sort in reverse. This is accomplished with a - in front of
the keyword name.
```

```
    ps SORT=-IDLE NPROCS=15

  Several options are available for selecting only a part of all tasks
  for output. For example, SCHEDULED-option displays only scheduled tasks,
  WAIT-option displays only waiting tasks and ACTIVE-option displays
  tasks that have recently used CPU time. See the
               options
               -section
  for other similar options.

  It's possible to combine keywords like ACTIVE and SCHEDULED, this would
  print all scheduled tasks that have recently used CPU time:

    ps ACTIVE SCHEDULED

  If you have installed MultiUser and have logged in as some else than
  root, ps will print only those tasks that belong to you. To override
  this, you the option ALL.

  CTRL-C will stop the output.

EXAMPLES

  ps

  Show all devices:

  ps NAME=*.device

  Show stack usage:

  ps FORMAT=PID,PRI,NICE,STACK,STACKUSE,STACK%,TIME,CPU%,NAME
```

1.52 ps options

```
PS OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

FORMAT

  Template:  F=FORMAT/N
  Tooltype:  FORMAT
  Default:   PID,PRI,RPRI,NICE,TYPE,STATE,TIME,IDLE,CPU%,NAME

  The format string. Separate keywords with a comma. Use < before the
  keyword to align the header to left and > to right. Use /<width> after
  the keyword to specify width for variable width keywords, e.g. NAME.

  This will align the NAME-header to right and the width of this field
  will be 40 characters:

    ps FORMAT=>NAME/40
```

```
SORT

  Template:  S=SORT/N
  Tooltype:  SORT
  Default:   PID

  The sort order. Separate keywords with a comma. Use - before the
  keyword to sort in reverse with this keyword.

  It's sometimes useful to specify multiple keywords here, for example,
  if you want to sort tasks by CPU%, the tasks with 0 CPU% will be in
  random order. If you first sort with PID, these tasks will be sorted
  by their PID:

    ps SORT=PID,CPU%

  Try this and

    ps SORT=CPU%

  compare the results!

LIST

  Template:  LIST/S
  Tooltype:  LIST

  List all keywords. This will print the keyword name, its header,
  alignment, width (fixed or variable), default width and minimum
  width (if variable width keyword).

NOHEADER

  Template:  NH=NOHEADER/S
  Tooltype:  NOHEADER

  Don't print the header.

PADHEX

  Template:  PH=PADHEX/S
  Tooltype:  PADHEX

  Hex numbers will be padded with 0:s, for example, fdc920 becomes
  00fdc920.

PLAIN

  Template:  PLAIN/S
  Tooltype:  PLAIN

  Don't use ANSI codes in output.

DELAY

  Template:  DELAY/N/K
  Tooltype:  DELAY
```

```
  Default:   0

  Delay specified number of seconds before outputting the task list.
  I added this option so I could see if a screenblanker creates a
  task when it blanks the screen.

INVERSE

  Template:  IV=INVERSE/S
  Tooltype:  INVERSE

  Inverse task selection. For example:

    ps SCHEDULED INVERSE

  output tasks that are NOT scheduled.

ACTIVE

  Template:  ACTIVE/S
  Tooltype:  ACTIVE

  Output tasks with non-zero CPU%.

IDLE

  Template:  IDLE/S
  Tooltype:  IDLE

  Output tasks with zero CPU%.

SCHEDULED

  Template:  SCHED=SCHEDULED/S
  Tooltype:  SCHEDULED

  Output scheduled tasks.

RUN

  Template:  RUN/S
  Tooltype:  RUN

  Output tasks that are running at the moment. If you don't have
  a multiprocessor Amiga, this will output only the current task. ;)

READY

  Template:  READY/S
  Tooltype:  READY

  Output tasks that are ready, but not running.

WAIT

  Template:  WAIT/S
  Tooltype:  WAIT
```

```
  Output tasks that are waiting.

ALL

  Template:  ALL/S
  Tooltype:  ALL

  If you have installed MultiUser and you have logged in as some else
  than root, ps will print only those tasks that belong to you. Using
  this option you can override this and print all tasks. This option
  isn't available if MultiUser hasn't been installed.

OWN

  Template:  OWN/S
  Tooltype:  OWN

  If you have installed MultiUser, this option will print only those
  tasks that belong to you. This is the default if you have logged
  in as some else than root. This option isn't available if MultiUser
  hasn't been installed.

PID

  Template:  P=PID/K
  Tooltype:  PID

  Print tasks with this PID. You can list multiple PIDs here, separate
  them with a comma.

USER

  Template:  U=USER/K
  Tooltype:  USER

  Print tasks that belong to these users, separate user names with a comma.
  This option isn't available if MultiUser hasn't been installed.

GROUP

  Template:  G=GROUP/K
  Tooltype:  GROUP

  Print tasks that belong to these groups, separate user names with a
  comma. This option isn't available if MultiUser hasn't been installed.

NAME

  Template:  N=NAME/K
  Tooltype:  NAME

  Print tasks that match the given name. You can use * as a wildcard.

PGRP

  Template:  R=PGRP/K
```

```
  Tooltype:  PGRP

  Print tasks in this process group. You can list multiple pgrps here,
  separate them with a comma.

PRIGT

  Template:  PRIGT/N/K
  Tooltype:  PRIGT

  Print tasks with greater priority than the given value.

PRILT

  Template:  PRILT/N/K
  Tooltype:  PRILT

  Print tasks with lower priority than the given value.

PRIEQ

  Template:  PRIEQ/N/K
  Tooltype:  PRIEQ

  Print tasks with the same priority as the given value.

NPROCS

  Template:  NPROCS/N/K
  Tooltype:  NPROCS

  Maximum number of tasks to print.

EVERYTHING

  Template:  EVERYTHING/S
  Tooltype:  EVERYTHING

  This will print information using ALL keywords. You should redirect
  the output to a file, because it will hundreds of characters wide.

BABY

  Template:  BABY/S
  Tooltype:  BABY

  Print the Executive internal task records, probably not very
  interesting, I use this for debugging.

TASK

  Template:  TASK/S
  Tooltype:  TASK

  Print the information structure associated with each task.

PROCESS
```

```
  Template:  PROCESS/S
  Tooltype:  PROCESS

  Print the information structure associated with each DOS-process.

CLI

  Template:  CLI/S
  Tooltype:  CLI

  Print the information structure associated with each CLI-task.

CPU

  Template:  CPU/S
  Tooltype:  CPU

  Print several CPU usage values of each task.

HELP

  Template:  HELP/S
  Tooltype:  HELP

  Display this text.

VERSION

  Template:  VERSION/S
  Tooltype:  -

  Display version number.
```

1.53 ps Keywords

```
                PS KEYWORDS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

General keywords

  CPU%
    Recent (last minute) CPU usage percentage.

  CSW
    Number of
                context switches
                 for this task.

  CTIME
    CPU time used by this task's terminated childtasks.

  GID
    Group ID. Only available if MultiUser has been installed.
```

```
GROUP
  Group name. Only available if MultiUser has been installed.

ETIME
  Elapsed time since task was created.

IDLE
  How long task has been idle, without using any CPU time.

IVCSW
  Number of
              involuntary context switches
               for this task.

LSTART
  The exact task creation moment, including date.

NAME
  Task name. Names of CLI processes are in square brackets.

NICE
  Nice-value for this task.

PID
  Process ID.

PPID
  Parent Process ID.

PRI
  Task's priority.

RPRI
  Task's
              REAL priority
              .

STACK
  Size of task's stack.

STACK%
  Percentage of stack used.

STACKUSE
  How many bytes of stack is currently used.

START
  The time when task was created.

STATE
  This will be one of these:
    run      task is running
    ready    task is ready to run
    wait     task is waiting
  These states are very rare:
    invalid  something is really wrong with this task
    added    task has just been added
```

```
      except   task is in exception state
      removed  task is being removed

  TIME
    Used CPU time.

  TIME%
    Percentage of CPU time used from total available CPU time.

  TTIME
    Cpu time used by this task and its terminated childtasks.

  TYPE
    Task type. This can be:
      task   task
      proc   process
      cli    interactive CLI (always a process)
      bcli   background CLI (always a process)

  UID
    User ID. Only available if MultiUser has been installed.

  USER
    User name. Only available if MultiUser has been installed.

  VOCSW
    Number of
                voluntary context switches
                 for this task.

Task-structure keywords

  These keywords print the entire Exec task-structure and aren't probably
  very interesting if you're not a programmer. They are listed in the
  same order as the appear in the structure, see <exec/tasks.h>.

  PRI
    Task priority. (tc_Node.ln_Pri)

  TASK
    Task-structure address.

  TNAME
    Task name. Not same as NAME, which might be the CLI-process name.
    (tc_Node.ln_Name)

  FLAGS
    Task's flags: (tc_Flags)
      P  process
      T  task
      p  proctime
      e  has etask-extension
      S  stackchk
      x  except
      s  switch-vector in use
      l  launch-vector in use
```

```
STATE
  Task state. See above. (tc_State)

NESTING
  Interrupt disabled nesting / Task disabled nesting.
  (tc_IDNestCnt, tc_TDNestCnt)

SIGALLOC
  Signals allocated. (tc_SigAlloc)

SIGWAIT
  Signals task is waiting for. (tc_SigWait)

SIGRECVD
  Signals task has received. (tc_SigRecvd)

SIGEXCEPT
  Signals task will take excepts for. (tc_SigExcept)

TRAPALLOC
  Traps allocated. (tc_TrapAlloc)

TRAPABLE
  Traps enabled. (tc_TrapAble)

EXCEPTDATA
  Points to except data. (tc_ExceptData)

EXCEPTCODE
  Points to except code. (tc_ExceptCode)

TRAPDATA
  Points to trap data. (tc_TrapData)

TRAPCODE
  Points to trap code. (tc_TrapCode)

STACKPTR
  Stack pointer. (tc_SPReg)

STACKLOW
  Stack lower bound. (tc_SPLower)

STACKUPR
  Stack upper bound + 2. (tc_SPUpper)

SWITCH
  This vector is called when task is losing CPU. (tc_Switch)

LAUNCH
  This vector is called when task is getting CPU. (tc_Launc)

USERDATA
  For use by the task. (tc_UserData)

From V36 upwards Exec has been able to allocate a structure called
```

```
  ETask, which stands for 'extended task'. The tc_TrapAlloc and tc_TrapAble
  are replaced with tc_ETask pointer and these two values are moved
  to the ETask structure. It isn't used by anything I know, but you
  can print the structure with these keywords:

  ETASK
    ETask address. (tc_ETask)

  ET_PARENT
    Pointer to task-structure. (tc_ETask->et_Parent)

  ET_ID
    ID unique to this task. (tc_ETask->et_UniqueID)

  ET_RESULT1
    First result. (tc_ETask->et_Result1)

  ET_RESULT2
    Result data pointer (AllocVec). (tc_ETask->et_Result2)

Process-structure keywords

  These keywords print the entire DOS process-structure and aren't probably
  very interesting if you're not a programmer. They are listed in the
  same order as the appear in the structure, see <dos/dosextens.h>.

  SEGLIST
    Array of seg lists used by this process. (pr_SegList)

  PRSTACK
    Process stack size. (pr_StackSize)

  GLOBVEC
    Global vector for this process (BCPL). (pr_GlobVec)

  CLINUM
    CLI task number of zero if not a CLI. (pr_TaskNum)

  PRSTACKUPR
    Pointer to high memory end of process stack. (pr_StackBase)

  RESULT2
    Value of secondary result from last call. (pr_Result2)

  CURDIR
    Lock associated with current directory. (pr_CurrentDir)

  CIS
    Current CLI Input Stream. (pr_CIS)

  COS
    Current CLI Output Stream. (pr_COS)

  CONTASK
    Console handler process for current window. (pr_ConsoleTask)
```

```
  FSTASK
    File handler process for current drive. (pr_FileSystemTask)

  CLI
    Pointer to CommandLineInterface. (pr_CLI)

  RETADDR
    Pointer to previous stack frame. (pr_ReturnAddr)

  PKTWAIT
    Function to be called when awaiting message. (pr_PktWait)

  WINDOW
    Window for error printing. (pr_WindowPtr)

  HOMEDIR
    Home directory of executing program. (pr_HomeDir)

  PRFLAGS
    Flags telling dos about process. (pr_Flags)
      s   freeseglist
      d   freecurrdir
      c   freecli
      i   closeinput
      o   closeoutput
      f   freeargs

  EXITCODE
    Code to call on exit of program or NULL. (pr_ExitCode)

  EXITDATA
    Passed as an argument to pr_ExitCode. (pr_ExitData)

  ARGS
    Arguments passed to the process at start. (pr_Arguments)

  SHELLPRIV
    For the use of the current shell. (pr_ShellPrivate)

  CES
    Error stream - if NULL, use pr_COS. (pr_CES)

CLI-structure keywords

  These keywords print the entire CLI-structure and aren't probably
  very interesting if you're not a programmer. They are listed in the
  same order as the appear in the structure, see <dos/dosextens.h>.

  IOERR
    Value of IoErr from last command. (cli_Result2)

  SETNAME
    Name of current directory. (cli_SetName)

  COMMDIR
    Head of the path locklist. (cli_CommandDir)
```

```
  RETCODE
    Return code from last command. (cli_ReturnCode)

  COMM
    Name of current command. (cli_CommandName)

  FAIL
    Fail level (set by Failat). (cli_FailLevel)

  PROMPT
    Current prompt (set by Prompt). (cli_Prompt).

  STDINPUT
    Default (terminal) CLI input. (cli_StandardInput)

  CURINPUT
    Current CLI input. (cli_CurrentInput)

  EXECUTE
    Name of EXECUTE command file. (cli_CommandFile)

  CLITYPE
    Interactive or background. (cli_Interactive, cli_Background)

  CUROUTPUT
    Current CLI output. (cli_CurrentOutput)

  DEFSTACK
    Stack size to be obtained in long words. (cli_DefaultStack)

  STDOUTPUT
    Default (terminal) CLI output. (cli_StandardOutput)

  MODULE
    Seglist of currently loaded command. (cli_Module)

Executive internal task-structure keywords

  These keywords print some parts of the Executive internal
  task information structure, which is created for each task.

  I use these for debugging and they aren't very useful for anybody
  else, so I don't explain these here.

  BABY
  BABYNEXT
  BABYPREV

```

1.54 pstree

```
                PSTREE
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

Display all tasks in a tree-like structure.

```
                OPTIONS
                DESCRIPTION
```

This client displays the task tree, the child-parent relationships. You can easily see from the output what tasks have been created by some other task. Pictures tell more than thousand words, so here:

```
+---trackdisk.device
+---gvpscsi.device
+---RAM
+---XH0
+---[QMouse]
|   +---[pstree]
|   |   `---CON
|   `---[Make]
|       +---CON
|       `---[sh]
|           `---[cc1]
+---[CyberCron]
`---input.device
```

The root of the tree is at left. Tasks that branch from here don't have a known parent, i.e. they have been created before Executive server was started. To see a more complete tree, you should start the server in s:startup-sequence, just after SetPatch is run.

You can see that QMouse has created two tasks, pstree and Make. Both are CLI processes, so they have created a CON process. The Make task has also created a shell, which has started a C-compilation.

If you are using AmigaGuide V39 or newer, you can see that the pstree and Make tasks are displayed with italic characters. This means that the task which created them has terminated. In a case like this they are not left orphans, they are transferred to their 'grandparents'.

```
  With the SHOWPIDS-option you can display task PIDs:

  +---[QMouse] (5)
  |   +---[pstree] (9)
  |   |   `---CON (224)
  |   `---[Make] (8)
  |       +---CON (236)
  |       `---[sh] (1)
  |           `---[cpp] (10)
  ...

  Now you can root the tree to a specific PID. This is actually a
  process group, but in Executive they both mean the same:

  pstree PGRP=8

  `---[Make] (8)
      +---CON (236)
      `---[sh] (1)
          `---[gcc] (10)

EXAMPLES

  pstree
```

1.55 pstree options

```
PSTREE OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

PGRP

  Template:  R=PGRP/N
  Tooltype:  PGRP

  Root the task tree to a specific process group.

SHOWPIDS

  Template:  SP=SHOWPIDS/S
  Tooltype:  SHOWPIDS

  Display PIDs in the output.

IBM

  Template:  IBM/S
  Tooltype:  IBM

  If you're using IBM style font, try this option, it uses graphical
  characters from this font to produce nicer output.

PLAIN
```

```
  Template:  PLAIN/S
  Tooltype:  PLAIN

  Don't use ASCII characters in output.

BACKSLASH

  Template:  BS=BACKSLASH/S
  Tooltype:  BACKSLASH

  The ` chracter may not look too good with all fonts, so with this option
  you can change it to \.

DELAY

  Template:  DELAY/N/K
  Tooltype:  DELAY

  Delay (in seconds) before outputting the tree.

HELP

```

1.56 renice

```
                RENICE
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Change task's nice-value.

                OPTIONS
                DESCRIPTION

  Renice is used to increment the
                nice-value
                 of a task, or multiple tasks
  at once.

  The maximum nice-value is +20, making the task `nice' to others, i.e.
  it will be given less CPU time that to a task with nice-value -20,
  which is the minimum value.
```

I want to stress that the value given to renice is INCREMENT, not the final value. You can use negative increments to get lower values.

Renice can affect multiple tasks at once:

```
renice 5 PID=10,20 NAME=DH\* USER=root GROUP=staff PGRP=273
```

The following tasks will be affected by this command:

- tasks with PID 10 and 20
- tasks with name starting with 'DH' (case insensitive).
- all tasks owned by the root user. (MultiUser only)
- all tasks owned by the staff group. (MultiUser only)
- all tasks that belong to process group 273.

The new nice-value will be old + 5.

If you don't specify any task, the nice-value of the current task (usually a CLI process) will be affected.

There's no need to use the NICE- and PID-keywords, ctp works without them too:

```
renice -10 278
```

This will add -10 to the nice-value of the task with PID 278.

The PGRP-option is sometimes very useful. Let's say you have a cron-utility installed in your system (I have). Cron is a program that runs in background and executes commands at specific times, as defined by user. I use cron to take backups every day of important files and to check viruses. Pstree shows that I have four cronjobs running:

```
+---[CyberCron] (4)
|   +---Virus_Checker(C) (235)
|   +---[find] (1)
|   +---[LhA] (10)
|   `---[tar] (11)
...
```

These use a lot of CPU time and the scheduler keeps their priority lower, but we could still make them 'nicer'. That's simple:

```
renice 20 PGRP=4
```

This will affect the CyberCron task and all its childtasks and also all tasks created by CyberCron from now on.

When MultiUser is installed, only the super-user may use negative nice-value increments. If you don't want to require root privileges for renice, set the U-bit using MProtect.

EXAMPLES

Add 10 to the current task's nice-value.

```
  renice 10

  Force the nice-value to -20 for 'input.device'. Because the maximum
  nice-value is +20, we must subtract at least 40 from it to always get
  to -20. If the nice-value would be 0, this would still be ok, because
  renice makes sure that the nice-value doesn't go below -20.

  renice -40 name=input.device
```

1.57 renice options

```
RENICE OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

NICE

  Template:  NICE/N
  Tooltype:  NICE

  Increment of nice-value for the specified tasks.

PID

  Template:  P=PID
  Tooltype:  PID
  Default:   Current task

  PIDs of the tasks whose nice-value is to be incremented. You can
  list multiple PIDs here, separate them with a comma, for example
  'PID=10,248,332'.

NAME

  Template:  N=NAME/K
  Tooltype:  NAME

  Names of the tasks whose nice-value is to be incremented. You can
  list multiple names here, separate them with a comma, for example
  'NAME=DH0,DH1,DH2,*.device'. You can use * as a wildcard.

USER

  Template:  U=USER/K
  Tooltype:  USER

  Names of the users whose every task's nice-value will be incremented.
  You can list multiple user names here, separate them with a comma, for
  example 'USER=frodo,pippin,gandalf'. You can also use UIDs. This option
  isn't available if MultiUser hasn't been installed.

GROUP

  Template:  G=GROUP/K
  Tooltype:  GROUP
```

```
  Names of the groups whose every task's nice-value will be incremented.
  You can list multiple group names here, separate them with a comma, for
  example 'NAME=staff,students'. You can also use GIDs. This option isn't
  available if MultiUser hasn't been installed.

PGRP

  Template:  R=PGRP/K
  Tooltype:  PGRP

  PGRPs of the process groups whose nice-value will be incremented. All
  tasks in the process group will be affected. You can list multiple PGRPs
  here, separate them with a comma, for example 'PGRP=254,298,578'.

```

1.58 sa

```
                SA
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Print system accounting statistics.

                OPTIONS
                DESCRIPTION

  Sa prints a summary of accounting records and optionally writes this
  summary to disk. By default, per-command statistics will be printed.
  The number of times a command has been executed, total CPU time used
  and total elapsed time. If you're using MultiUser, you can also get
  per-user statistics.

  Sa maintains two summary files, 'acct.procsum' and 'acct.usersum'.
  These contain the accounting records according to command name and
  user ID, respectively.

  The per-command statistics output looks like this:

  COMMAND                     CALLS   CPUTIME  CPUTIME%   ELAPSED
  NComm30                        11     1h50m    23.39%     8h39m
```

```
lzx                              36     1h09m    14.73%     2h31m
Mosaic                           16    19m45s     4.18%     1h49m

ACUSeeMe_020                      1     0.15s     0.00%     3.58s
stack                           327     0.00s     0.00%     0.36s
...
```

For example, ‘Mosaic’ has been executed 16 times, 19 minutes 45 seconds of CPU time was used, which is 4.18% of all commands in the summary. The commands were in the system for 1 hour 49 minutes.

The per-user statistics output looks like this (if MultiUser has been installed):

```
USER       COMMANDS   CPUTIME   CPUTIME   ELAPSED
-              8634     7h43m    97.85%    70h34m
root             13     9m14s     1.95%    22m06s
petrin            9    55.48s     0.20%     4m06s
```

Most of the commands, 8634, were executed without logging in to the MultiUser system, so the username is ‘-’. These commands have used 7 hours 43 minutes of CPU time. The ‘root’ user has used 1.95% of the CPU time and root’s commands were in the system for 22 minutes 6 seconds.

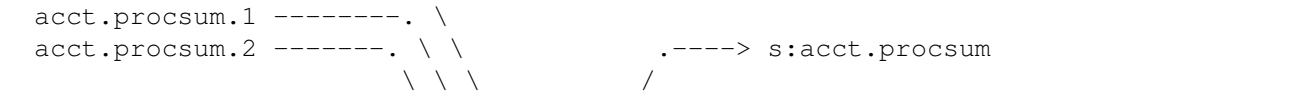
It’s possible to sort the summary in different ways. The default is to sort the summary by used CPU time, but it’s also possible to sort by elapsed time, by command name, by an average command execution time or by number of times a command was executed.

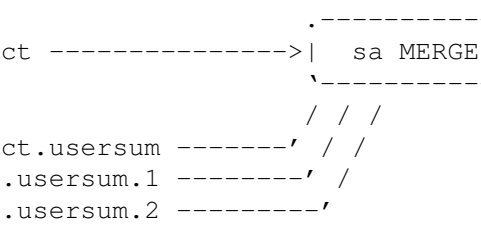
When you run sa it will read the accounting file created by acct and the summary files. The new accounting records will be added to the summary. The MERGE option instructs sa to write the summary back to disk and delete the current accounting file. The summary will be printed to screen. To see per-user summary use the USER-option.

If you have multiple accounting summary files, you can merge them with sa, for example:

```
  sa PFILE=s:acct.procsum.1,acct.procsum.2 UFILE=acct.usersum.1,
     acct.usersum.2 MERGE
```

This will read the ‘s:acct’-file, ‘s:acct.procsum’, ‘s:acct.usersum’ and the four files named above and merge them to ‘s:acct.procsum’ and ‘s:acct.usersum’. The ‘s:acct’-file will be deleted. This picture shows what the command does:





If you want to run sa automatically every day, you need a cron-program, for example CyberCron. You can get it from Aminet, in the util/time directory.

Sa doesn't require that the server is running.

Sa asks the acct-daemon to write all unpurged records to disk so they will be included in the summary.

CTRL-C will stop the output.

EXAMPLES

Show a per-command summary:

```
sa
```

This will join all records to a single group called ***other:

```
sa JOINLONELY THRESHOLD=9999999
```

1.59 sa options

SA OPTIONS
~~~~~~

ACCTFILE

Template: F=ACCTFILE
Tooltype: ACCTFILE
Default: s:acct

The accounting file name.

SUMMARYDIR

Template: SDIR=SUMMARYDIR/K
Tooltype: SUMMARYDIR
Default: s:

The directory where the summary files 'acct.procsum' and 'acct.usersum' are written.

AFILE
~~~~~~

```
  Template:  AFILE/K
  Tooltype:  AFILE

  This is like the ACCTFILE-option, but you can list several accounting
  files here, separated by a comma. For example: 'AFILE=acct.1,acct.2'.

PFILE

  Template:  PFILE/K
  Tooltype:  PFILE

  This is used when merging multiple summary files. You can specify
  several procsum-summary files, separated by a comma. For example:
  'PFILE=ap.1,ap.2,ap.3'.

UFILE

  Template:  UFILE/K
  Tooltype:  UFILE

  This is used when merging multiple summary files. You can specify
  several usersum-summary files, separated by a comma. For example:
  'UFILE=au.1,au.2,au.3'.

MERGE

  Template:  MERGE/S
  Tooltype:  MERGE

  Merge the acct-files and all given summary files and write the
  new summary files 'acct.procsum' and 'acct.usersum' to SUMMARYDIR
  (default directory for summary files is s:).

NOACCT

  Template:  NOACCT/S
  Tooltype:  NOACCT

  Don't read the accounting-file (s:acct).

NOSUMMARY

  Template:  NOSUMMARY/S
  Tooltype:  NOSUMMARY

  Don't read the summary files. This will output a summary of the
  accounting-file (s:acct).

USER

  Template:  U=USER/S
  Tooltype:  USER

  Print the by user -accounting summary (acct.usersum).

JOINLONELY
```

```
  Template:  JL=JOINLONELY/S
  Tooltype:  JOINLONELY

  Join all commands that have been executed only one time to a group called
  '***other'. See the THRESHOLD-option also.

  This only affects the printed summary.

THRESHOLD

  Template:  TH=THRESHOLD/N/K
  Tooltype:  THRESHOLD
  Default:   1

  Used with JOINLONELY-option. If command has been executed only as
  many times as you specify here, it will be joined to a group called
  '***other'. For example, 'JOINLONELY THRESHOLD=10' will join all
  commands that have been executed 10 times or less to a group '***other'.

QUIET

  Template:  QUIET/S
  Tooltype:  QUIET

  Don't print the summary to screen.

NOHEADER

  Template:  NH=NOHEADER/S
  Tooltype:  NOHEADER

  Don't print the header.

SORTBYCALLTIME

  Template:  SCAT=SORTBYCALLTIME/S
  Tooltype:  SORTBYCALLTIME

  Sort the summary by an average command execution time.

SORTBYNAME

  Template:  SN=SORTBYNAME/S
  Tooltype:  SORTBYNAME

  Sort the summary by command name.

SORTBYCALLS

  Template:  SC=SORTBYCALLS/S
  Tooltype:  SORTBYCALLS

  Sort the summary by number of times each command has been executed.

SORTBYCTIME

  Template:  SCT=SORTBYCTIME/S
```

```
  Tooltype:  SORTBYCTIME

  Sort the summary by CPU time.

SORTBYETIME

  Template:  SE=SORTBYETIME/S
  Tooltype:  SORTBYETIME

  Sort the summary by elapsed time.

REVERSE

  Template:  RV=REVERSE/S
  Tooltype:  REVERSE

  Reverse sort.

```

1.60 timer

```
                TIMER
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Time command execution.

                OPTIONS
                DESCRIPTION

  The timer client executes a command and measures its CPU usage. If
  timer is started without a command name or it's started from
  Workbench, it will open a window where you can drop program icons.

  Arguments can be given for the timed command as usual. If you're using
  a custom shell like csh or sksh, it's possible to run commands under
  that shell. Several clients use this feature, read about it from
                here
                .

  Timer provides normal or verbose output. The normal output consists
```

of one line of information, it will be printed after the command has been executed. For example:

```
time 0:00:04.79 + child 0:00:37.83 = total 0:00:42.62, elapsed 0:01:48.98
```

This means that the command consumed 4.79 seconds of CPU time. Its childtasks (i.e. the tasks that it created) used 37.83 seconds of CPU time. This number includes the childtasks that were still running when the main command terminated. The command and its childtasks used 42.62 seconds of CPU time. 1 minute and 48.98 seconds of real time elapsed while the command was running.

The verbose output looks like this:

```
Task time                    0:00:05.27  (  3%)
Childtasks time              0:02:48.79  ( 97%)
Running childtask time       0:00:00.00  (  0%)
================================================
TOTAL USED CPU TIME          0:02:54.06  (100%)

Elapsed time                 0:03:55.30
CPU-usage                    73.97%
```

This command used 5.27 seconds of CPU time, which is 3% of the total CPU time used by the command and its childtasks. Those childtasks that terminated before the main command used 2 minutes and 48.79 seconds of CPU time, which is 97% of the total used CPU time. No childtasks were running when the main command terminated. 3 minutes 55.30 seconds of real time elapsed while the command was running. Of this time, this command and its childtasks used 73.97% of the total available CPU time.

The timing accuracy is 1/1000 seconds. The CPU time values are very accurate, they don't include the overhead that goes to task creation and loading it from disk. Neither does the elapsed time include any overhead, it's the time that elapses between AddTask() and RemTask() calls.

Timer can be used even if the server isn't running. Then only the elapsed time can be calculated.

When you start timer from Workbench, or if you have Workbench running and start timer from CLI without the command name, it will open a window on the Workbench screen. You can drop program icons to this window.

In normal mode, timer will output the total CPU time used by the command and all its childtasks, elapsed time and CPU usage. You can switch to verbose mode by selecting the menu item Settings->Verbose. The produced output is identical to what is explained above. Window's titlebar displays the number of commands currently being executed.

If the command that you want to run doesn't have an icon, timer will ask CLI arguments for it.

EXAMPLES

```
  This will start timer and open a window on Workbench screen. If you
  don't have Workbench running, this won't work.

  timer

  This times the c:Dir command:

  timer c:Dir

  This times the c:Dir command and gives verbose output:

  timer VERBOSE c:Dir

  As above, but appends the output to a file T:timer.out

  timer VERBOSE OUTPUT=T:timer.out APPEND c:Dir
```

1.61 timer options

```
                TIMER OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

OUTPUT

  Template:  O=OUTPUT/K
  Tooltype:  OUTPUT

  This is used to redirect the output of the timer-command to a file.
  For example:

    timer OUTPUT=T:timer.out dir

  will output to T:timer.out file.

APPEND

  Template:  A=APPEND/S
  Tooltype:  APPEND
  Default:   overwrite

  Used with the OUTPUT-option. Instead of overwriting the specified file,
  append to it.

VERBOSE

  Template:  V=VERBOSE/S
  Tooltype:  VERBOSE
  Default:   output timing information on one line

  Tell timer to give verbose output.

STDOUT

  Template:  STDOUT/S
```

```
  Tooltype:  STDOUT
  Default:   output timing information to stderr

  By default, the timing information is outputted to standard error
  stream, which can't be redirected. By using this option, the timing
  information will be outputted to standard output stream.

LEFT

  Template:  LEFT/N/K
  Tooltype:  LEFT
  Default:   0

  Offset of the left edge of the window relative to screen.

TOP

  Template:  TOP/N/K
  Tooltype:  TOP
  Default:   0

  Offset of the top edge of the window relative to screen.

SHELL

  Template:  S=SHELL/K
  Tooltype:  SHELL
  Default:   Run command under standard Amiga shell

  If you're using a custom shell, you can specify here a
                template
                 that is
  used when starting a command under that shell.

COMMAND

  Template:  C=COMMAND/F
  Tooltype:  COMMAND

  The command to be timed and its arguments.
```

1.62 top

```
                TOP
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Display and update information about the tasks using most of the
  CPU time.

                OPTIONS
                DESCRIPTION

  Top displays the "top 10" tasks using most of the available CPU time.
  You can specify how many tasks are displayed.

  Top will also display other information like load averages, number
  of tasks, CPU usage, current time and available memory.

  Top opens a window where it displays this information. The information
  will be updated periodically (by default every second).

  Top's display might look like this:

  load averages:  0.63,  0.37,  0.10                                15:51:36
  32 tasks: 31 sleeping, 2 running        CPU usage:  18.1%
  chip: 758K  fast: 5451K  virtual: 0K  total: 6209K  largest: 3966K

    PID USERNAME  PRI NICE STATE   TIME     CPU NAME
     10 petrin    -89    0 ready   0:06  58.75% [lha]
    216 -           4    0 wait    0:13  18.42% suprascsi.device
    201 -          20    0 wait    0:22   2.44% input.device
      1 root      -70    0 wait    0:07   1.74% [Quickgrab]
      9 -         -51  -15 run     0:01   0.67% [top]
      6 -         126    0 wait    0:01   0.46% Executive
    202 -          10    0 wait    0:00   0.32% DH2
    211 -           5    0 wait    0:05   0.14% CON
      3 -           5    0 wait    0:01   0.12% [ASwarm]
    223 -          10    0 wait    0:01   0.11% DH0

  Load averages are similar to what is displayed by
                uptime
                .

  There are 32 tasks in the system, 31 of them are sleeping, 2 are running
  or ready. The current CPU usage is 18.1%, this is for the last second.
  The next line displays the available memory. Top supports GigaMem, and
  displays how much of it is available.

  PID is the process identifier. USERNAME is displayed if MultiUser
  has been installed. PRI is the task priority and NICE is task's nice-
  value. STATE is wait, ready or run. TIME is the amount of CPU time
  the task has used. NAME is the task name. If it's in square brackets,
  it's a CLI command name.
```

```
  The menu item Project->New will redraw the display. The menu item
  Settings->Update sets the update interval. If you set the Settings->
  No idle tasks menu item, idle tasks won't be displayed. The Settings->
  Stay front keeps top's window in front of all other windows.

  When you double-click a task, top will ask you if you want to send
  a break signal to this task.

  It's possible that running top while using communication programs
  causes errors in transfer, because top needs to disable multitasking
  and interrupts for a brief moment when it updates its display. I have
  tried to keep the time as short as possible and on my 68030/25MHz
  top doesn't cause any errors.

EXAMPLES

  top

  Like above, but show 15 tasks:

  top 15

  Don't show idle tasks, update every 5 seconds:

  top NOIDLE UPDATE=5

  Use a different font:

  top FONT=courier FONTSIZE=13
```

1.63 Top options

```
TOP OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

TASKS

  Template:  T=TASKS/N
  Tooltype:  TASKS
  Default:   10

  Number of tasks to display.

NOIDLE

  Template:  NI=NOIDLE/S
  Tooltype:  NOIDLE
  Default:   Show idle tasks also

  Don't show idle tasks.
```

```
UPDATE

  Template:  UD=UPDATE/N/K
  Tooltype:  UPDATE
  Default:   1

  The update interval (in seconds).

FONT

  Template:  F=FONT/K
  Tooltype:  FONT
  Default:   System default font

  Font to be used in top's window. You might want to use a small
  font, so you can display more tasks. Top can only use mono-spaced,
  non-proportional fonts.

FONTSIZE

  Template:  FS=FONTSIZE/N/K
  Tooltype:  FONTSIZE
  Default:   System default font size

  If you specify a font, you should also specify the font size.

STAYFRONT

  Template:  SF=STAYFRONT/S
  Tooltype:  STAYFRONT

  Keep the window in front of all other windows.

PUBSCREEN

  Template:  PS=PUBSCREEN/K
  Tooltype:  PUBSCREEN
  Default:   Workbench

  Name of the public screen where the window is to be opened.

LEFT

  Template:  LEFT/N/K
  Tooltype:  LEFT
  Default:   0

  Offset of the left edge of the window relative to screen.

TOP

  Template:  TOP/N/K
  Tooltype:  TOP
  Default:   0

  Offset of the top edge of the window relative to screen.
```

  Stat outputs miscellaneous information about the system and
  Executive:
```

```
Registered to
  If your name isn't here, then shame on you! ;-)

Boottime
  The time when your machine was booted.
Uptime
  How long your machine has been up.
Load average
  System load averages, 1, 5 and 15 minutes.
Total used CPU time
  How much CPU time has been used and how many percentages that is
  from uptime.
Total idle CPU time
  How long the CPU has been idle.
Context switches
  Number of context switches been made.

Tasks created/terminated
  Number of tasks added and removed from the system.
Tasks running/sleeping
  Number of tasks currently running or sleeping.
Number of clients/handlers
  Number of clients currently connected to the server. A handler is
  created by a client that needs to update its display frequently
  (e.g. ALoad and top).
Number of known windows
  How many opened windows has a known owner.

Scheduler
  Currently used
              scheduler
              .
Timer
  Currently used
              timer
              .
Catch range & Dynamic range
  See the
              server documentation
                Time resolution
  The accuracy of CPU usage measurements.
Watched tasks
  How many task's are currently being
              watched
              .

Accounting has been [de]activated
  Tells you if accounting is on or off.
Seconds before purge
  How many seconds to wait (maximum) before writing records to disk.
Max records in memory
  Maximum number of records held in memory at once.
Unpurged records
  Records currently in memory
Accounting daemon pid
  The PID of the acct daemon.

```

1.66 uptime

```
                UPTIME
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

  Display the current time, the length of time the system has been up,
  the number of users, and the load averages.

                OPTIONS
                DESCRIPTION

  Uptime displays current time, length of time the system has been
  up, number of users (with MultiUser), and load averages over the
  last 1, 5, and 15 minutes on a single line. If started from Workbench,
  a window will be opened and the information will be displayed in
  window's titlebar. This information will be updated by default
  every second.

  Unlike other uptime utilities for Amiga, this one displays correct
  uptime, there's no need to run any programs or daemons when the system
  is booted.

  Uptime is displayed as 'up 10 mins', 'up 1:43' (one hour, 43 minutes)
  or 'up 7 days'.
```

```
  The number of users currently logged in is got from multiuser.library.
  It's only shown if MultiUser has been installed.

  The load averages are displayed as three numbers, for example:

    load: 2.12, 0.67, 0.15

  This means that over the last minute, approximately 2.12 tasks have
  been running or ready to run. The higher the number, the higher the
  load in your computer is, i.e. the more tasks there are fighting for
  CPU time. The other two numbers are for 5 and 15 minutes, respectively.

  When uptime is run from Workbench, it opens a window and displays this
  information in the window's titlebar. You can choose update interval
  from menus, as well as what information should be displayed.

  The Settings->Stay front menu item, when set, keeps the uptime
  window in front of all other windows.

EXAMPLES

  uptime

  uptime NOTIME NOUSERS

  uptime WINDOW

  uptime WINDOW NOTIME NOUSERS NOUPTIME LEFT=50

TECHNICAL NOTES

  Uptime is current time minus RAM-disk creation time.
```

1.67 uptime options

```
UPTIME OPTIONS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

WINDOW

  Template:  W=WINDOW/S
  Tooltype:  NOWINDOW
  Default:   Use window if started from Workbench

  If uptime is started from Workbench, it will open a window to show
  the information. This can be overridden with the NOWINDOW-tooltype.
  If you start uptime from CLI, you can tell it to use window by using
  the WINDOW-option.

NOTIME

  Template:  NOTIME/S
```

```
  Tooltype:  NOTIME

  Don't display the current time.

NOUPTIME

  Template:  NOUPTIME/S
  Tooltype:  NOUPTIME

  Don't display uptime.

NOUSERS

  Template:  NOUSERS/S
  Tooltype:  NOUSERS

  Don't display the number of users currently logged in.

NOLOAD

  Template:  NOLOAD/S
  Tooltype:  NOLOAD

  Don't display load averages.

UPDATE

  Template:  UD=UPDATE/N/K
  Tooltype:  UPDATE
  Default:   1

  Update interval in seconds, used only when the information is
  displayed in a window.

STAYFRONT

  Template:  SF=STAYFRONT/S
  Tooltype:  STAYFRONT

  Keep the window in front of all other windows.

LEFT

  Template:  LEFT/N/K
  Tooltype:  LEFT
  Default:   0

  Offset of the left edge of the window relative to screen.

TOP

  Template:  TOP/N/K
  Tooltype:  TOP
  Default:   0

  Offset of the top edge of the window relative to screen.
```

```
PUBSCREEN

  Template:  PS=PUBSCREEN/K
  Tooltype:  PUBSCREEN
  Default:   Workbench

  Name of the public screen where the window is to be opened.

HELP

  Template:  HELP/S
  Tooltype:  HELP

  Display this text.

VERSION

  Template:  VERSION/S
  Tooltype:  -

  Display version number.
```

1.68 About custom shells

```
ABOUT CUSTOM SHELLS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

These two clients have to execute CLI commands:

  * nice
  * timer

Commands are normally run under the standard Amiga CLI, but if you're
using a custom shell, you can run commands under it, and even run the
shell's internal commands. This is accomplished with an environmental
variable called EXECUTIVESHELL.

This variable contains a shell command which is used to start the
command under a custom shell. Here are some examples:

  csh:    csh -c %c
  sksh:   sksh -c %c
  ksh:    ksh -c %c

So, if you're using csh-shell, set the EXECUTIVESHELL to "csh -c %c"
with these commands:

  setenv EXECUTIVESHELL "csh -c %c"
  copy ENV:EXECUTIVESHELL ENVARC:

The %c is substituted with the command name and its arguments.

You can now run internal shell commands and use its aliases and even
pipes, if they're supported by the shell. You may have to use \| instead
of | if you want to use pipes this way.
```

If you need to use the % character in the command, use %% instead.

I'm using csh and I have this command in my s:.cshrc:

```
cd A:Com/Dl
```

This will change the directory to A:Com/Dl so that when I start a new csh, it will always be in the same directory. Now, I must use this EXECUTIVESHELL variable:

```
csh -c "cd %d ; %c"
```

The %d is substituted with the current directory. This is needed because otherwise csh would try to start all commands from A:Com/Dl-directory, not from the directory I have run the timer or nice client. For example, if I'm in directory WORK:Programs and do this:

```
WORK:Programs> timer lha x TMP:archive.lha
```

Timer will execute this command:

```
csh -c "cd WORK:Programs ; lha x TMP:archive.lha"
```

This ensures that the archive is extracted to the directory WORK:Programs.

If you're using some other shell that is mentioned above, tell me what EXECUTIVESHELL variable you are using so I can add it here.
