MKPATH is designed to lessen the amount of keying when creating and changing to DOS directories.

For example, you have to create c:\data\wp\letters and f:\backup\data\wp\letters and you want to end up in c:\data\wp\letters, after making the directories on both drives current.

The DOS commands would be (assuming none of the lower levels exist):

```
md c:\data
md c:\data\wp
md c:\data\wp\letters
cd c:\data\wp\letters
md f:\backup
md f:\backup\data
md f:\backup\data\wp
md f:\backup\data\wp\letters
cd f:\backup\data\wp\letters
c:
```

MKPATH will do all this with one command:

```
mkpath f:\backup\data\wp\letters c:\data\wp\letters
```

YOU count how many keystrokes you save, even with DOSEDIT or DOSKEY!

If you don't want to change to the created directory, simply type /NO after MKPATH, e.g. MKPATH /NO C:\A\B\C.
