

Instance Inspector:

The instance inspector provides a different means of changing a part or group of parts.

The matrix of buttons at the top of the window allow the user to reflect the selected part or parts about the particular axis. The matrix of buttons in the lower half of the window allows the user to scale or translate the selected part in the direction of the selected axis or rotate it about the selected axis. The stepping value affects the scaling, translation and rotation. For scaling, the stepping value is the scaling factor: scaling with a stepping value of two would double the size in the particular direction. For translation, the stepping value indicates the number of units to translate. For rotation, the stepping value indicates the number of radians the part will rotate.
