

Setting up a framework project;↩Setting up a framework project

- 1 Create a project with Framework as the project type.
- 2 Add header (.h) and implementation (.m) files to the project.
- 3 Specify which header files, if any, should be private.

A framework is a bundle containing a dynamic shared library. Both Framework and Library project types build dynamic shared libraries. The difference is that frameworks bundle the library file with its headers, documentation, and resources.
