Replacingcodeallatonce;¬Replacing code all at once

1   Open the Project Find panel.

2   Perform a search for symbol definitions or references, or for text strings.

3   Type in the Replace field the text to replace the entry in the Find field.

4   Replace the text globally or selectively:

arrow.eps ¬   Globally: Click the Replace button.

Or

arrow.eps ¬   Selectively: Select the items in the search results to replace, then click the Replace button.

5   Confirm the replacement.

The Project Find panel allows you to replace symbols in your code or other text at one time. Use the Project Find panel when you prefer simultaneous replacement project-wide rather than sequential replacement within a file.

_Find_Replacing.eps ¬

Select contiguous multiple items by dragging across them; select non-contiguous items by Shift-clicking. If you want the replacement made to every item in the search results, leave all items unselected.

When you click the Replace button, Project Builder prompts you for confirmation before performing the replacement.

_Find_Replacing3.eps ¬

You can undo replacement changes with successive Edit arrow.eps ¬ Undo arrow.eps ¬ Undo commands.

See the task ªReplacing code sequentiallyº for this alternate search-and-replace technique.
