

Transferring Images Within TextArt

You can copy an image from the Image Display Window to a Layout Board window by double-clicking or command-clicking on the image. This will create a TextArt image object in the topmost Layout Board window and make it the key window. If no Layout Board window exists, TextArt will create a new one for you.

You can copy a TextArt image from a Layout Board window to the Image Display Window by double-clicking or command-clicking on the image. The TextArt image will replace the image in the Image Display Window. If you double-click on a grouped graphic, TextArt will find one of the TextArt graphics in the group to copy to the Image Display Window.

You can also use normal copy and paste menu commands to copy images back and forth between the Image Display Window and Layout Board windows. To bring the current image from the Image Display Window to a Layout Board window without making the Image Display Window active, choose **Copy Display (command-d)** from the Image menu and then choose Paste.

To get an arbitrary section of the Image Display window, **Click** and **Drag** out a selection rectangle in the TextArt Image Display Window, bring a Layout Board window forward and **Paste**.

If you hold the **Alternate** key while dragging a selection rectangle in the Image Display Window, the section in the selection rectangle will be automatically pasted to the top Layout Board window, which will become the key window.

Transferring Images To Other Apps

To transfer an image from TextArt to other applications, you can save a Layout Board document as TIFF or EPS, and

open it in the other application [see *Saving Files*]. You can also select images in the Layout Board window, **Copy** them into the Pasteboard, switch to the other application, and **Paste**. The other application must understand TIFF or EPS format.
