Rotation

The Text Rotation slider and text field allow you to rotate the text.

Rotation has different meanings in different modes.

In **Basic** mode, the rotation indicates the angle in degrees of the text. When the rotation is 0, the text is horizontal and reads from left to right. When the rotation is 180, the text is also horizontal, but is upside down and reads from right to left.

In **Rose** mode, the rotation indicates the angle of the top copy of the text; when the rotation is set to 0, the top copy will be horizontal.

In **Circle**, **Upper Arc**, and **Lower Arc** modes, rotation moves the text around the circumference of the circle. AutoCenter overrides any specified rotation.

See *Slider Control* under *Controls* for information about controlling the slider and text field.
