Layout Board

Layout Board windows allow you to combine a number of graphic elements into a final document. You can work with more than one TextArt image, add geometric shapes and import EPS and TIFF images.

The graphic elements in a Layout Board window are treated as individual objects which you can move, resize, and modify. There are several types of objects:

>TextArt images
>EPS and TIFF images
>Geometric shapes (lines, rectangles, ovals, polygons,
>>curves, and freehand shapes)
>Text

To create a new Layout Board window, choose **New** (**command-n**) from the Window menu. Alternatively, if you double-click on the Image Display Window and you haven't opened or created a Layout Board window, TextArt will create a new one for you (and copy the current TextArt image to it). You can open previously saved Layout Board documents by choosing **Open...** (**command-o**) from the Window menu (see *Files*). You can have as many Layout Board windows open as you want.
