Window Control

TextArt uses a lot of windows and panels, but they don't all need to be visible at once. The Show & Hide menu under the TextArt Image menu lets you control which windows are visible. You can:

Show All Image Windows: Display every Image Control Panel, the Main Parameters Panel, and the Image Display Panel.

Hide All Image Windows: Hide every Image Control Panel, the Main Parameters Panel, and the Image Display Panel. This is useful when you're working in a Layout Board window. If you want to have all image windows hidden automatically when you switch to a Layout Board window, use the Preferences... command from the Windows menu (see *Preferences*).

Show Pertinent Windows: This won't hide any panels, but it will display any that are used by the current image and aren't currently visible.

Hide Impertinent Windows: Hide any Image Control Panels that aren't used by the current image. This helps to reduce screen clutter. If you want this to happen automatically, you can set a preference to hide image control panels when not in use (see *Preferences*).
