Slider Controls

The slider/text field combination controls have some special features that allow you easily to set the values you want.

To **reset** a slider to its default value (for example, 0 degrees for Rotation), hold down the **Command** key and click the slider.

To change the **maximum value** of a slider, enter a new maximum into the slider's text field and press the **Carriage Return** key. Now you can use the slider to set a value up to the new maximum. This applies to sliders with arbitrary maximums (such as the Vertical and Horizontal Scale sliders).

When a slider appears to limit you to whole number (integer) values, hold the **Alternate** and **Shift** keys and click on the slider. Now you'll be able to enter decimal (floating point) values using either the slider or the text field. To return to whole number values, reset the slider by clicking it while holding the **Command** key.

To move the slider by a small amount (for example, 1 degree in Rotation) hold down the **Alternate** key while dragging the slider. Be sure to leave the key down until you have released the mouse button.

Holding down the **Alternate** key AND the **Shift** key splits this amount in half (for example, you can move by .5 degree in Rotation).

Holding down the **Alternate**, **Shift** and **Command** keys again splits the amount in half (for example, .25 degrees in Rotation).
