1.1 CYCAS DEMO - Help - Edit

Selecting and editing drawing elements:

You edit elements by simply selecting the elements you
want to work on. To select the elements, the "Select"
menu options will appear below the main menu instead of
any function list. The selection menu enables access to
all drawing elements. Its easier to use than explain!

For example .. you want to delete a line you have drawn
1) Select "Edit"
2) Select "Delete" from the function list
3) Use the mouse and click on the line you want to delete
4) Select "OK"

The function list "Edit" contains edit functions like
Copy or Move, etc.

Therefore, in order to edit elements you first choose
the elements you want to work on. All selected (active)
elements are displayed white. If you leave the selection
menu using the button "OK", the function list reverts
back and you continue.

In the selection menu you activate and deactivate all
elements you want to work on until you leave the menu
using OK or Exit. While selecting elements you can
change the detail enlargement in order to have a better
view of your drawing.

In "Edit" you should pay attention to the function Move
/ Point. This function offers many possibilities in
order to edit single points of the elements. I.e. you
can use Move / Point to edit the dimensions linked to
elements or you can edit 3D elements working in the
various projections.
