

Search and Search/Replace

The search and search/replace features in WordPerfect 6.0 are enhanced so that more specific codes can be searched for in the document.

The search string is a word string. This allows all WP characters to be represented. Functions are represented in the search string by translating them into an unsigned integer (one word) "special search code" which is in the range of 64256 (0xFB00) to 65279 (0xFEFF).

The first number on each line represents the search code value first in decimal and then in hex. The characters that follow in parentheses indicate if the functions can be searched (s), replaced (r), or search/replaced (s,r). The last piece of information is the label or name of the function represented by this value.

The following tokens are handled differently than normal search tokens. **These tokens are not used on the DOS version of WP 6.0.** Any of the functions below that have the "sp" indicator are used with these 3 search commands. Unless a "s" or "r" indicator accompanies the "sp" indicator, this function can only be used with these 3 tokens. These special search and replace tokens must be the same function type (although they will have different values) or an error will occur when the search takes place. In other words, a Left Margin Set must be replaced with another Left Margin Set.

SpSearchString(Token)
SpReplaceString(Token)
SpDeleteString(Token)
