Kaspersky® Anti-Virus is recommended
by many respected computer publications
and holds many certificates from
independent test labs:

The Company Today. Kaspersky Labs is an international software-development company offering advanced products for protection against viruses, hackers and spam. Founded in 1997, Kaspersky Labs operates four offices in Russia, France, the United Kingdom, and the United States (CA), and distributes its products in 60 countries via a well-established partner network. The company consists of 250 highly qualified specialists, among whom 9 hold MBA degrees, 15 PhD degrees, and 2 are members of the prestigious Computer Anti-virus Researchers Organization (CARO).

Unique Experience and Knowledge. For fourteen straight years we have waged battle against computer viruses, allowing us to gain unique knowledge and skills that together represent our most valuable asset. Our in depth experience permits us to foresee developing virus trends and to beforehand ward off attacks. This unique virtue has become a fundamental part of Kaspersky Labs products and services and enables us to always stay one step ahead of the competition and to provide our customers with the very best protection.

Products. Kaspersky Labs, through hard work and dedication has become a technology leader in the development of virus defenses. The company was the first to develop many technological standards in the anti-virus industry. Kaspersky Labs' fundamental product, Kaspersky® Anti-Virus, dependably protects all virus penetration points on stand-alone computers, workstations, file servers, Web servers, e-mail systems, firewalls and handheld computers. Convenient management features give the opportunity to maximize the anti-virus defense of computers and corporate networks alike. Clear affirmation of the high quality of Kaspersky Labs products is the number of respected data protection software developers that have chosen the Kaspersky® Anti-Virus kernel to drive their very own products, including Nokia ICD (USA), F-Secure (Finland), Aladdin (Israel), Sybari (USA), G Data (Germany), Deerfield (USA), Alt-N (USA) and Microworld (India).

Comprehensive Technology Security. Contemporary malicious programs are complex, multifunctional systems deeply integrated with the Internet. Traditional anti-virus methods are no longer enough to ensure reliable defense against external threats. Kaspersky Labs was therefore compelled to develop the personal firewall - Kaspersky® Anti-Hacker, and a unique spam filtration system designed for small and medium size business - Kaspersky® Anti-Spam. These products received the full benefit of our vast experience and expertise. The combined usage of our products achieves the maximum level of defense against virus code and other external data security threats.

Services. Kaspersky Labs customers get a wide spectrum of services guaranteeing the continuous trouble-free operation of our products and which precisely match their specific requirements. Users get round-the-clock technical support and daily anti-virus database updates. Organizations and enterprises benefit from a unique set of services made available in connection with the design, implementation and maintenance of anti-virus systems.

KASPERSKY®

ANTI-VIRUS

PERSONAL PRO

Working with office documents, creating graphic images or developing databases you need to be sure that all data, information and documents are under protection. The only way to do this is to install powerful anti-virus protection software that will control all potential sources of malicious code penetration. Kaspersky® Anti-Virus Personal Pro is specially designed to provide experienced users with full-scale control and protection for multiple applications they use daily. Kaspersky® Anti-Virus Personal Pro comprises a set of unique functions and technologies which makes advanced anti-virus technologies available for home use.

Kaspersky® Anti-Virus ensures the required level of computer anti-virus protection: the program continually checks email, protects data stored on all disks and supports the verification of archived and compressed files. Kaspersky Anti-Virus has a unique system allowing it to intercept script-viruses, and also possesses the ability to identify even unknown viruses. With its anti-virus databases updating daily via the Internet Kaspersky Anti-Virus offers a fully automated virus defense.

ZDNet (France), 2002

Consistently the most thorough and best value anti-virus package that we have tested over the years.

PC User, 2001

Reliable control over all sources of virus infection

Kaspersky® Anti-Virus Personal Pro provides permanent control over all possible sources of virus penetration like e-mail, Internet, diskettes, CDs, etc. The software also performs comprehensive checks of all data stored on a computer including system memory, boot sectors, files, and e-mail databases. It also contains unique technology protecting documents in MS Office formats.

Efficient real-time virus protection

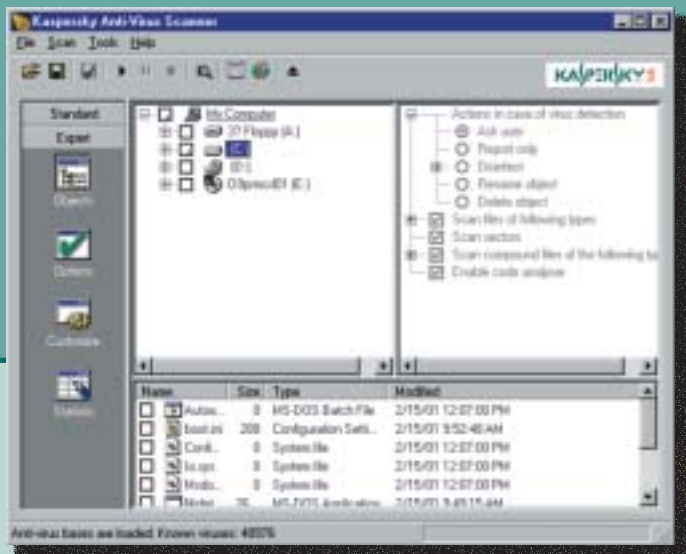

Kaspersky® Anti-Virus Personal Pro provides you with constant real-time virus protection. Files are checked for viruses each time they are started, created or copied. The scanning module, integrated into the deepest level of the operating system, comprehensively controls all file operations and prevents attacks from new viruses. Kaspersky® Anti-Virus Personal Pro also provides users with comprehensive on-demand checking of all local and network drive contents. Scans can be started manually or automatically according to a predefined schedule and support archived and compressed files. Even if the file containing a virus has been compressed or archived multiple times using various archiving utilities, Kaspersky® Anti-Virus will detect the malicious programs.

Comprehensive virus checking in e-mail messages

Kaspersky® Anti-Virus Personal Pro automatically checks for viruses in all incoming and outgoing messages in real time to prevent viruses from penetrating a computer. The software efficiently removes viruses from e-mail immediately upon reception and restores the original contents. Supporting many e-mail database formats (MS Outlook, MS Outlook Express, MS Exchange, Eudora, MS Mail, Pegasus Mail, Netscape Mail, JSMail, MIME), the program reliably guards against viruses in e-mail message storage. The program automatically checks for viruses in all message areas, i.e. attached files (including archived and compressed files), other messages on any nesting level, embedded OLE objects and the message body.

100% protection for documents in MS Office format!

Kaspersky® Anti-Virus Personal Pro supplies constant control over the execution of macros in documents stored in MS Office format, prohibiting all suspicious actions. In this way the software guarantees 100% protection from destructive macro-virus activity.

The near legendary detection capabilities of Kaspersky Anti-Virus did not fail it in this test, with it again performing at VB 100% award level.

Virus Bulletin (UK), 2002

Reliable control over data integrity

The Kaspersky® Inspector module in Kaspersky® Anti-Virus Personal Pro detects any unauthorized changes on your computer, which can be caused by many factors, including virus activity. Should such changes be detected the software performs a complete disinfection.

Protection from even unknown viruses

Kaspersky® Anti-Virus Personal Pro is powered by a unique integrated technology based on the principals of second-generation heuristic analysis. Thanks to this, the program is able to protect your computer against even unknown viruses at a detection rate of nearly 90%.

Quarantine

The special quarantine feature can be activated to isolate infected objects in a safe place. Just specify the quarantine directory to where the program will move all potentially harmful objects for further inspection.

Protection against script-viruses

Most conventional anti-virus monitors are unable to protect your computer against the destructive activity of script-viruses operating in system memory. Kaspersky Labs has developed a special utility - Script Checker™ - that completely solves this problem by integrating itself as a filter between the script-virus and the application, that will process it. It enables you to check for viruses in any script before it is executed.

Automated virus protection

Sometimes you simply forget to scan your disks for viruses. Kaspersky® Anti-Virus Personal Pro enables the creation of flexible schedules by which its components are automatically run. You can also download the anti-virus database updates via the Internet and apply them automatically.

Daily anti-virus database updates via the Internet

New viruses appear every day. The more frequently you update your anti-virus software the more reliable your protection. Using the Updater™ technology you can easily download the latest anti-virus database and application-module updates from the Internet or from local servers automatically. Should any problems appear during update download like network connection break, Kaspersky® Updater will continue the process choosing the least loaded server. The list of available servers is modified automatically. The size of daily updates is just from 3 to 20KB!

Universal boot system

The software's capabilities can be extended with the Rescue Kit boot system that is designed to restore a computer to working order after it has been attacked by a virus. The Rescue Kit creates a set of bootable diskettes, which contain the Linux OS and an anti-virus scanner. It permits a "clean boot" and helps users to restore their home PC disks using any of the most popular file systems: FAT (DOS), FAT32 (Windows 95/98/ME), NTFS (Windows NT/2000/XP), HPFS (OS/2), EXT (Linux).

SYSTEM REQUIREMENTS:

- Processor: Intel® Pentium® 150MHz or higher
- OS: Windows 95/98/ME, Windows NT 4.0 Workstation (Intel) with Service Pack 3, Windows 2000 Professional, Windows XP Home Edition or Windows XP Professional
- Other software: Internet Explorer version 4.01 (SP2) or later
- At least 32 Mb RAM
- At least 25 Mb space available on the hard disk
