

Using your own databases with the demo version of LinkUP!

There are two options for working with your own data and LinkUP! depending on where the data is held.

The quickest option is to export the data from your application into an ASCII text file. This can then be prepared for use with LinkUP! using the LinkDB application that is also on the CD. For information on how to process your ASCII data with LinkDB, refer to the LinkDB manual in the folder "LinkUP "

If you want to be able to work live with your data, then you will need an ODBC connection – please refer to the separate read me file in this folder regarding ODBC.

Please contact our customer services department or your reseller if you require any further information.
