## The MailDoor™ Multi-domain Mail Clerk

Adding to its suite of multi-domain products for the Macintosh, Open Door Networks is proud to bring you the MailDoor Multi-domain Mail Clerk. MailDoor works in concert with the Apple Internet Mail Server (AIMS) to sort incoming mail by domain name and to forward that mail to the appropriate accounts within each domain. MailDoor enables you to define complete sets of independent mail addresses for each domain, providing each domain with its own "Webmaster," "Info" and other standard e-mail addresses. MailDoor also helps you to better keep track of e-mail addresses on a domain-by-domain basis.

**Multiple independent addresses:** As shipped by Apple, AIMS e-mail addresses are independent of domain name. Without MailDoor, you can have only one "Webmaster" address, one "Info" address, etc., regardless of the number of domains you're supporting. With MailDoor, you can set up multiple unique addresses with the same name.

**Automatic mail forwarding:** MailDoor automatically forwards mail sent to the addresses it's managing. Thus mail sent to the different "Webmaster" or "Info" addresses can be automatically routed to the appropriate managers for those addresses.

**Forwarding of misaddressed mail:** MailDoor can be set up to forward mail sent to addresses which don't exist, forwarding such mail on a domain-by-domain basis. MailDoor can even forward mail for domains which haven't been set up yet to an address of your choice.

**Better management of your mail addresses:** MailDoor provides a straightforward, convenient way to keep track of your e-mail addresses on a domain-by-domain basis.

**Another piece of the multi-domain puzzle:** In combination with Open Door's HomeDoor and LogDoor products, MailDoor helps to complete the multi-domain puzzle. With Open Door products you can now use one Macintosh to provide home pages, real-time statistics and log files, and unique sets of e-mail addresses for multiple domain names.

**Developed to meet a real need:** Open Door Networks Inc. is a Mac-based Internet and Web provider. We developed our multi-domain products in response to our customers' (and our own) needs. We think this experience gives us invaluable insight into the requirements of these applications. We hope you'll agree.

MailDoor features:

- Standalone application. Runs in parallel with your mail server.
- Enables independent e-mail addresses with the same name for different domains.
- Forwards mail to accounts on the same mail server or elsewhere on the Internet.
- Can forward misaddressed mail.
- Configurable mail forwarding rate.
- Domain-by-domain configuration of addresses.

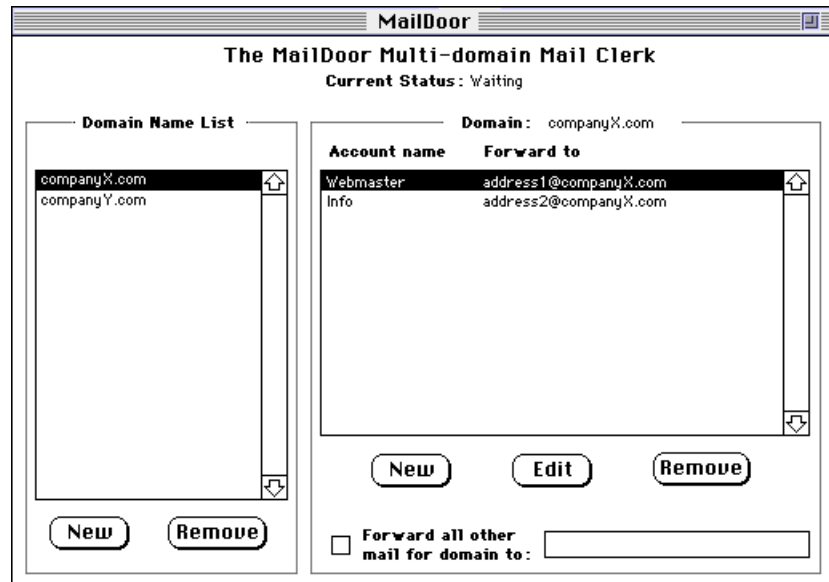

# MailDoor

## Features and Benefits

- Same-named addresses for different domains – enables you to provide each of your domains with standard e-mail addresses such as “Webmaster,” “Info,” “Sales,” etc. Eliminates the chance of name conflicts across domains.
- Flexible mail forwarding – can forward mail to accounts on the same server or anywhere on the Internet, automatically routing e-mail to those responsible for the different accounts at each domain.
- Forwarding of misaddressed mail – mail for entire domains can be forwarded, even if sent to an invalid address at that domain.
- Configurable mail forwarding rate – tune forwarding for maximum performance or minimal affect on your server.
- Domain-by-domain configuration – straightforward organization of addresses within each domain. Helps you to manage your e-mail accounts on a domain-by-domain basis.

## Requirements:

- Apple Internet Mail Server version 1.1.1 or later
- System 7.5 or later
- 500KB of application RAM

## Ordering information:

- Product details, pricing, users' guide and evaluation version available at <http://www.opendoor.com/maildoor/>
- Secure order form available at <http://www.opendoor.com/maildoor/maildoororder.html>
- Orders accepted via Web, e-mail, fax and phone
- VISA, MasterCard, American Express (corporate PO's by special request)
- Product distributed via FTP (or e-mail by request)
