Queued Sites: Getting Started

Queueing is a very powerful feature for automating the operation of WebStripper. Scheduling sets a site to be downloaded at a particular time, AutoUpdate makes WebStripper visit a site at regular intervals to download the latest updates. You can set as many sites to be downloaded at one time as you like. WebStripper will allocate it's downloading threads to whichever site needs them.

To set a site as Queued go into the **Add Site** or **Site Properties** window for a site, click the **Advanced** check box and change the settings on the appropriate pages.
