NEW RELEASES!

PASSWORD OFFICER

Forget your passwords!

With PASSWORD OFFICER, Compelson Labs' hottest new product, remembering (and forgetting) long and difficult passwords has become a thing of the past. Using sophisticated Smart Card technology it is now possible to have complex alphanumeric passwords randomly generated, stored in encrypted form on a Smart Card, and then easily brought up by a keystroke or a pop-up menu whenever needed.

SECURITY OFFICER

Browse the Internet in security

Security Officer might have a small footprint (at under 1 MB), but don't be fooled. Packed into this compact yet highly sophisticated 32-bit program is a virtual army of 'Security Officers' optimized to protect your computer 24 hours a day from Internet-borne viruses, data leakage, the execution of illicit programs and all forms of unauthorized tampering.

MORE 'OFFICER' PRODUCTS...

NOTES OFFICER

Your smart card drive

NOTES OFFICER makes it possible to use a smart card in the same way one would use a floppy, but there is a crucial difference: smart cards are far more robust, and they offer complete security against unauthorized access to all data stored on them -- every last byte! Your

important files cannot be stolen, illicitly copied, modified, erased or damaged. We all know this is hardly the case with a standard floppy. NOTES OFFICER also offers special security to LOTUS NOTES users.

[BUY IT NOW!](#)

CRYPTO OFFICER

The total encryption system

CRYPTO OFFICER is a program that encrypts and decrypts data on hard-drives as well as on diskettes, either continuously (on-line use) or upon request (off-line use). The data you have encrypted will not be accessible to any unauthorized individuals, even if your PC were ever to be stolen. CRYPTO OFFICER is a product that is particularly suited to owners of notebook computers!

SMART-CARD READERS

Personal Card System: 202 & 302

Universal Desktop Models!

Do to their ease of use, and the security inherent in anything that is so-called "hard-wired", smart cards are a hot topic. Now, thanks to Compelson's "Personal Card System" (or PCS), the home user equipped with any standard PC can also take advantage of the many practical uses of smart cards. When used in conjunction with the Compelson products mentioned above, the PCS can be used to securely

protect access to computers, to personal accounts, to banking operations or to entire networks. Various passwords need not be remembered, yet despite this, a much higher level of security is achieved. Auditing of user operations, on-the-fly encryption -- these are just some of the modern possibilities that the PCS provides.

PASSWORD OFFICER 2000

Password Officer 2000

Forget Your Passwords!

Everything is about information in this time and access to information is often password protected. We have to remember more and more passwords, change them more and more often, and they have to be more and more complicated. Unfortunately, it is also more and more dangerous to forget any of them, which makes working with computers more and more of a chore. But here is the solution.

Logging-in becomes:

- **Very Comfortable**
- **As fast as possible**
- **Very Secure**

**Password
Officer**

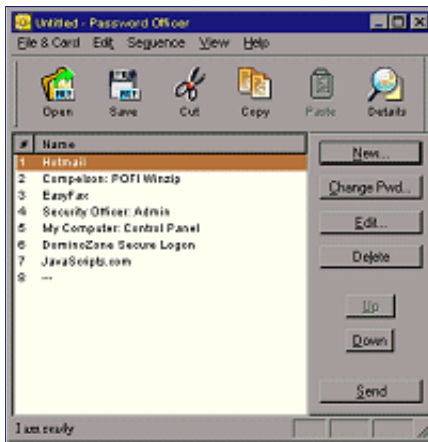

Why is Password Officer so useful?

- 1. stores all your passwords and log-in sequences**
- 2. encrypts them using one of the strongest algorithms available (finalist of NIST US government)**
- 3. enters passwords and sequences into your programs for you and in the fastest possible way**
- 4. no typos when typing in the password**
- 5. creates passwords for you - no spending time and effort trying to think up a new password and memorizing it**
- 6. creates high quality passwords - no hacker's dictionary attack possible**
- 7. controlling where password will go - no trojan horse attack possible**
- 8. no awkward situations - no password can be watched from your keyboard, and all your passwords are always with you (when using smart-card)**

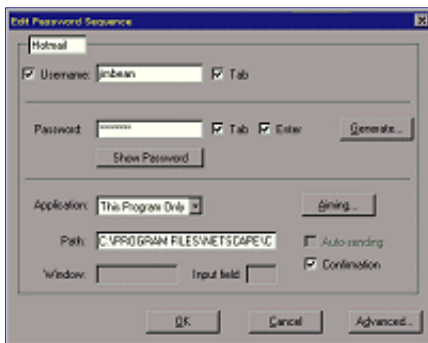

POFI was created by a team of highly skilled system programmers that program at the system level, writing perfectly optimized code. The result is small, reliable, secure, handy and we hope useful software application that proposes to solve all the problems and drudgery normally associated with using many passwords: Password Officer. We sincerely hope that you will like it. If not, please [write to us](#), if yes, [write to us too!](#)

Much time and effort was spent optimizing Password Officer in order to achieve the best user interface possible. The Compelson team analyzed various styles of work and attitudes in connection with the day to day typing in of passwords. Their goal was to create a product that was easy to use while still offering sophisticated functions that were comfortable and quick to use. But don't confuse 'simple to use' with 'simple'. Many advanced functions are accessible more deeply in Password Officer's interface, where advanced users can get at them, without overloading the standard user, who maybe doesn't care about encrypting their passwords, for instance.

SCREENSHOTS!

[main screen](#)

[sequence editing](#)

[the password wizard](#)

"Finally, a professional solution for the problem of too many passwords"

Maximum Security

Password Officer is the only password management application on the market that uses one of the strongest encryption algorithms in the world to protect your passwords: the 256-bit Twofish algorithm, which incidentally, is one of just five algorithms nominated by NIST as a possible future US Government security standard (replacing DES).

Other Great Use

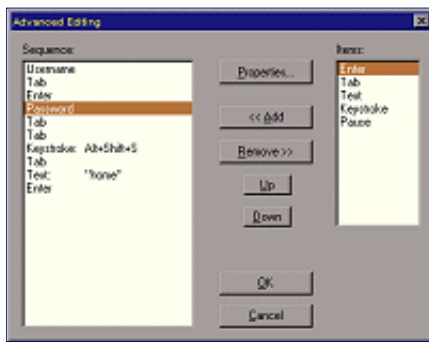

Although passwords are Password Officer's *raison d'être*, you can also use it for many other common and repetitive tasks. Use it to create macros to automate nearly any task, and because Password Officer can be set to load earlier than any other applications on your computer, you can even use it to log into Windows, a local area network, various system dialogs, and any other application requiring input from the user.

How to Use Password Officer

Define to its list all the usernames and passwords that you normally must remember and enter manually again and again. Then, in the simplest of terms, whenever one of them is required Password Officer will enter it for you. It can automatically enter whole sequences upon recognition of a specific application that requires it, or you can select which one to enter, and where. And Password Officer does not only enter the password securely, but will also type in your username, tab to switch to other fields, hit enter, press hotkeys, enter other text, and even pause for some determined amount of time. In this way, Password Officer is able to fill out entire forms for you and other complicated tasks. Furthermore, Password Officer is able to help you with another common problem associated with the use of passwords: coming up with effective passwords. Password Officer will auto-generate, according to your requirements, very secure passwords using the strongest encryption algorithms available (256-bit).

Run Password Officer at Start-Up

Obviously you can run Password Officer each time you need a given password, but the better solution is to set Password Officer to start every time you boot up your computer. (The "Run at system start up" option can be found in the File & Card - Settings menu).

SECURITY OFFICER

Security Officer 2000

Browse the Internet in Security

In these days of bloated software and interminable downloads - often not worth the bandwidth - we at COMPELSON LABORATORIES feel sure that you will be pleasantly surprised at the power packed into this program weighing in at less than one MB. Power and flexibility: from the beginning we designed Security Officer to be different things to different users. For the advanced user, it is an indispensable power-tool offering unprecedented system security in even the most hostile of computing environments (such as a high-school computer lab or Internet cafe). For the beginner user however, with no configuration necessary it is a straightforward and safe way to see what is really going on when you surf the net or run any application on your computer.

SECURITY OFFICER 2000 - FEATURE HIGHLIGHTS

(PLEASE CLICK ANY ITEM FOR MORE DETAILED INFORMATION)

File & Folder Protection

Files and folders can be protected from reading, writing, deleting or executing. You can protect local as well as network resources. It is useful against viruses, other users, and even your own mistakes. [more info...](#)

Data Loss or Damage Protection

The data on your hard-drive is protected at low-level against formatting, changes to vital system areas, low-level write attacks, etc. [more info...](#)

Anti-Virus Protection

All programs on your computer, your hard-drive's system areas, even your floppy can be protected from the effects of viruses - even ones that haven't been invented yet. Security Officer does not scan for viruses, it does not allow them to work. [more info...](#)

System Monitoring & Logging

Monitor all operations with files (reading, writing, deleting, renaming...), execution of programs or changes to your system's registry. You can watch what programs do, how they install or why things are not working. [more info...](#)

Internet Monitoring & Logging

Monitor all Internet connections, including email, http, ftp, etc. View flow of bytes and activities to each site, log websites visited, etc. [more info...](#)

Internet Download Protection

You can block the downloading of certain file types (MP3, ZIP etc.), and only for some users. [more info...](#)

Internet Access Protection

You can maintain a list of sites which will either not be accessible or which will only be accessible. You can forbid access to adult sites (containing certain text-strings, such as sex, nasty, girl) for your children. [more info...](#)

Computer Access Protection

Nobody without the correct password or smart-card will ever be able to access your Windows again. Your computer will be immediately locked when removing smart card. [more info...](#)

Smart-card Support

Available in **Security Officer Professional**, now Smart-cards can be used to log securely onto your system. Protect Windows from being accessed by anyone but you. [more info...](#)

Special Hardware Addition

Security Officer now also offers a special hardware addition for industrial strength secure logon. Without successful user identification by this PC card, absolutely no access is permitted to your machine - even the operating system is rendered inaccessible! [more info...](#)

Perfectly Optimized Software

Security Officer has been optimized for maximum power and flexibility, as well as for minimum size (less than one MB). And it is a cinch to install and uninstall! [more info...](#)

Security Officer can be purchased at our SECURE Online Store

FEATURES IN DETAIL

Perfectly Optimized Software

Security Officer has been optimized for maximum power and flexibility, as well as for minimum size (less than one MB). And it is a cinch to install and uninstall!

Powerful, yet easy on system resources and diskpace. And because it runs in your Windows system tray, it is always just one click away...

Security Officer is a very powerful 32-bit application that runs "below" your other applications, deep inside the Windows operating system itself. Accessible at any time from your Windows taskbar, it has been painstakingly designed to offer you the most advanced internet and system monitoring available, total flexibility to configure it as you require, while utilizing next to none of your system's valuable resources (less than 1%).

File & Folder Protection

File and folders are protected from viruses, other users, and even from your own mistakes. Set permissions that specify no reading, no writing, no deleting, no executing, etc.

With **Security Officer** file and folder protection is complete. One can define what are "program" files and what are "data" files and then set various protection levels for these file types based on drive/folder location - even hide files and folders from explorer. No-one will even know that they are on your computer. With Security Officer Professional one can even protect Network drives - essentially deciding for everyone who shares a LAN, whether executables may be run, whether files may be modified or deleted, or even read at all.

Data Loss or Damage Protection

Your hard-drive is protected at low-level against formatting, changes to vital system areas, low-level write attacks, etc.

Security Officer can further protect your system's vital parts. With **Security Officer** running and with these sophisticated protection options enabled, your system registry and other critical files and system structures can be protected absolutely. No other product offers this level of system protection.

Why Use Security Officer?

monitor program installations (you will see file, folder and registry manipulations)

monitor program behaviour (look where your browser stores files, applets, video streams and grab them)

helps you in solving problems

you can see what files programs are attempting to open, change etc.

protect data on your computer against damage

protect programs against virus infiltration

control what files & folders will be visible on your computer

control of access to your computer

Download Security Officer!

Now you can try Security Officer absolutely FREE!

Download it right now! (File is less than 1MB.)

Click to enlarge any of these screenshots...

Anti-Virus Protection

All programs on your computer, your hard-drive's system areas, even your floppy are protected from the effects of viruses, all viruses - even ones that haven't been invented yet.

Protection from computer viruses is certainly another important feature of **Security Officer**, but interestingly it does not protect by simply searching all files for all "known" viruses (as a scanner does), but rather **Security Officer** protects all programs on your computer, your hard-drive's system areas, even your floppy from the effects of viruses, all viruses - even ones that haven't been invented yet. Even if you had a virus on your computer (and we sincerely hope that you do not), with **Security Officer** protecting your files, further infection would actually be impossible.

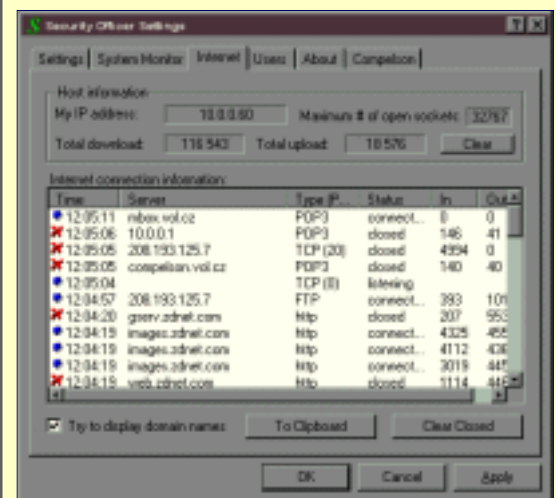

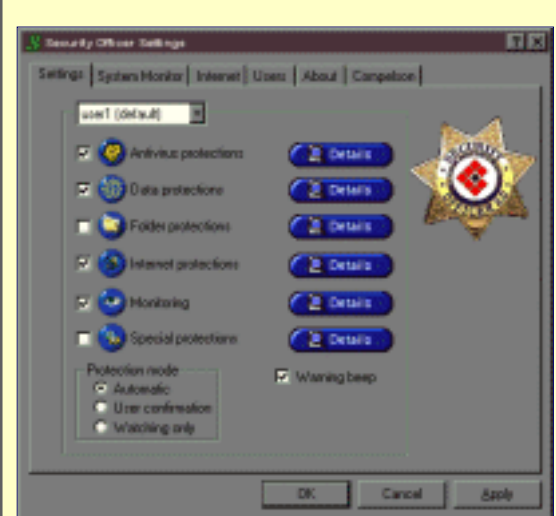

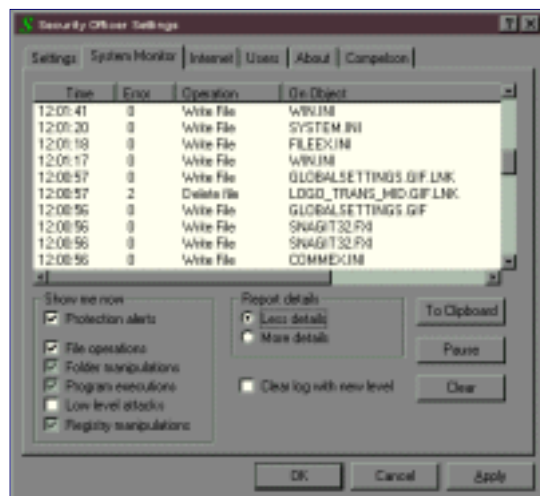

Further, **Security Officer** will not allow illicit actions by any programs. These include things like formatting of the hard-drive, destroying data, and damaging system areas of your hard-drive. **Security Officer** achieves this due to the fact that it is more than just another application, it also implements a revolutionary new driver which applies protection layers to the Kernel of Windows itself, protecting against both high-level attacks and low-level ones. This is what makes **Security Officer** so powerful. Many users are not aware that surprisingly, using a scan-based anti-virus program is actually worse for your system than using nothing at all (in the special case of an unknown virus being introduced to your system). This is due to the method by which anti-virus-scanners work (opening and closing your executables). Frighteningly, this can actually spread an unknown virus to every executable file on your system in a matter of minutes. **Security Officer** is the solution to this potentially serious problem when used in conjunction with your favourite scanning program.

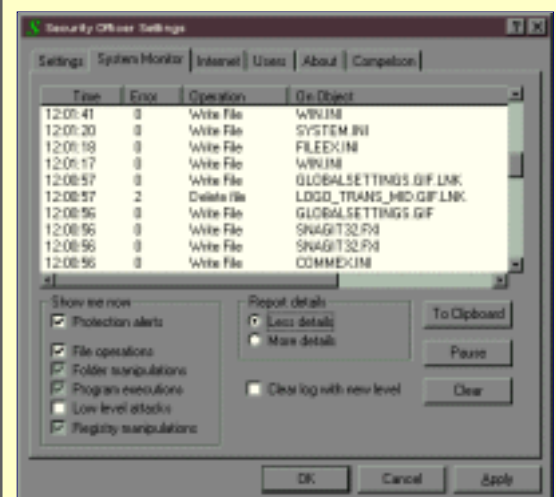

System Monitoring & Logging

Monitor changes to your system's registry, files being read or written, and the execution of programs - all things which are typically caused by any standard program installation.

See what is really happening inside your Windows system...

the Internet Monitor

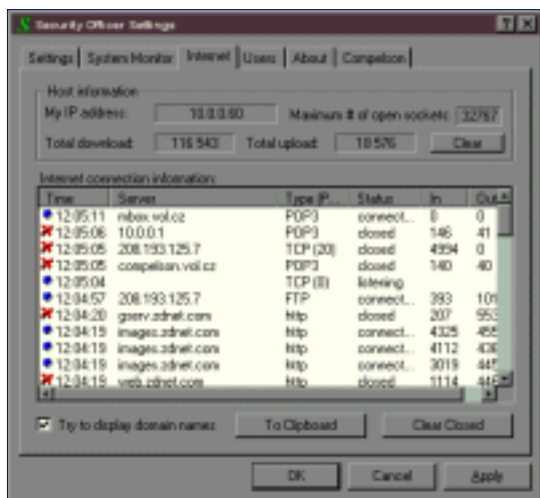

the System Monitor

Internet Monitoring & Logging

Monitor all internet connections, including email, http, ftp, etc. View total bytes downloaded and uploaded. Log websites visited, etc.

Are you and your family spending more and more time on the Internet? Do you need a way to limit access to sex-related sites for instance? Do you just want to know how many megabytes of information are being downloaded onto your machine in a given day, or in a given hour of surfing? Security Officer now allows you to see exactly what your browser is really doing, what your email client is really doing. And if want to log this information simply click the button marked "To Clipboard" and you can paste all info into the text editor of your choosing.

Security Officer Professional supports these COMPELSON Smart-card readers...

the PCS 302

the PCS PCMCIA

Smart-card Support

Available in Security Officer Professional, now Smart-cards can be used to log securely onto your system. Protect Windows from being accessed by anyone but you.

When running **Security Officer Professional** all your configuration functions are protected. Used this even more powerful version of the software to set up protection which only you can undo.

And using smart-cards of course, there won't even be the need to remember one central password. Perfect for those users who share workstations. Perfect for LAN administrators. Perfect for families.

Security Officer Professional optional hardware protection...

hardware card for maximum security

protections are active earlier than any software on your PC, incl. operating system

protects boot of your system

the ultimate in secure hardware login

vital protection of CMOS memory content

plug & play installation

Security Officer Professional

Now it is possible to configure Security Officer Professional to have different permissions set for different users:

- Allow access to computer only to certain individuals.
- Allow access to certain drives only to certain individuals.
- Allow access to certain folders only to certain individuals.
- Allow access to certain programs only to certain individuals.
- Allow access to certain files only to certain individuals.
- Allow access to certain websites only to certain individuals.

Who Needs Security Officer?

LAN ADMINISTRATORS

Perhaps you are the LAN administrator for your corporation. Use **Security Officer** to monitor who is accessing what sites, when, and for how long. Monitor total number of bytes downloaded or uploaded in a given session. Monitor what types of connections are being made to the internet (HTTP, FTP, SMTP, IRC, TELNET, etc.). Then export and save this information for later review. Or upgrade to **Security Officer Pro** for even more advanced features, such as filtering sites and/or content. For instance, set **Security Officer Pro** to ban downloading of MP3 files or files over a certain size. Protect your corporation's bandwidth!

PEOPLE WHO SHARE WORKSTATIONS

Or maybe you are an employee that shares his workstation with several other people. Set **Security Officer** to hide or protect certain files and/or folders - either from being read at all, or from being over-written. Set **Security Officer** to monitor attempts to access restricted documents or areas of your hard-drive. Even set **Security Officer** to monitor accesses (or attempted accesses) to the **Security Officer** configuration panel itself. Or in the case of **Security Officer Pro**, password-protect access to **Security Officer Pro** entirely. Or imagine a situation where a single machine is used to store sensitive documents regarding your family or business's accounting, and other important personal things (contracts, private photos, etc.), as well as being used to play games on by children.

INTERNET CAFE OWNERS

Do you run an Internet cafe (or a computer lab)? If so, you are probably looking for a way to **1)** protect and/or hide system critical file and folders which your clients have no business accessing **2)** Monitor attempts to access these forbidden areas of a given workstation **3)** disable access to the floppy drive **4)** virus protection **5)** screen certain websites from being accessed by your clients **6)** monitor overall bandwidth usage **7)** Log sites visited... **Security Officer** does all this and much more.

EVERYONE ELSE

The casual user maybe doesn't care what Microsoft Outlook 98 is really doing "deep down" when she checks her email. Maybe, and of course, that's fine. But we believe that even the casual user should be protected against Internet-borne viruses and the tampering with of sensitive documents. That is why **Security Officer** comes pre-configured for the average user with settings that might be considered "*healthy protection*" against the most common computer security problems (Word macro viruses, formatting of the hard-drive, unauthorized copying of files to floppy, and others). The advanced user of course, will jump right and in and begin tweaking, but for everybody else, **Security Officer** will be serving its primary function from the moment it is first run. And that was important to the way we saw **Security Officer's** ultimate role on YOUR computer.

HANDLING OF RESTRICTED FUNCTIONS

You define what constitutes a "restricted function", and you decide what **Security Officer** should do about it. Perhaps you only want it to log accesses to a certain folder or a certain file. Perhaps you want **Security Officer** to "disallow" what you have defined as a "restricted function". Or maybe you want **Security Officer** to prompt you for an "allow" or "disallow" when it encounters a "restricted function". It is entirely up to you, and that is what, potentially at least, makes **Security Officer** so useful to such a wide range of computer users.

[NOW COMPATIBLE WITH
MOST READERS...](#)

Every mobile phone user is familiar with the difficulties of entering names and phone numbers on those tiny, hard to use, numeric keypads. COMPELSON Labs has a unique solution. SIMedit! enables any mobile phone user to painlessly edit all the information stored in their mobile phone using any standard PC. Imagine being able to enter all those important phone numbers using a real keyboard! But SIMedit! actually does much more.

**click here to find
out more...**

The **SIMedit!** package, which includes the smart-card peripheral (**Personal Card System 302**) or PCMCIA, provides sophisticated editing and control of the phone book, SMS messages and other data stored in a mobile phone. These data are saved on a smart card (SIM card), which is the heart of every GSM phone.

Compatible with all GSM phones, **SIMedit!** offers a full range of functions for editing the contents of a SIM card, allowing the user to easily enter any missing contact information and to edit the contents of their mobile phone. **SIMedit!** provides rapid and effortless transfer of the phone book from a database, Excel spreadsheet or other Office application to a SIM card, ensuring that one's phone book is always up-to-date.

SIMedit! allows received messages to be archived to a file on computer disk, and also ensures the backup of

numbers from the phone book of a SIM card, so that in the event of damage or loss it is possible to quickly restore the data to its original state. Using the **SIMedit!** program it is now a simple matter to exchange sets of phone numbers with friends or colleagues. But **SIMedit!** does even more.

comfortable editing of phone book

immediate sorting, searching and replacing

easy exchange of contacts between phone and databases

easy backing up of entire SIM card

creating, sending and archiving of SMS messages

easy copying of contacts between phones

Now the Software is FREE!

The Award Winning SIMedit!

Read some of the rave reviews further down this page! For all of your SIM editing needs, **SIMedit! 3.5** is the professional choice, with superior features, simple installation, and ease of use.

Smart Card Peripheral Included!

Included in the **SIMedit!** package is the PCS 302, a revolutionary RISC processor driven smart card peripheral that can read from and write to all formats of smart cards and SIM cards, including the classic pre-paid telephone card. And it doesn't require its own power supply!

Notebook Users...

Now choose the PCS Mobile instead, and take advantage of our new PCMCIA smart-card reader.

Other Revolutionary Applications

Purchasing the PCS 302 now is an investment in the future. Because as Compelson releases more products compatible with the PCS 302 -- like the upcoming PASSWORD OFFICER -- you will be ready. Below are just some of the other smart card based applications you may run once you've installed the PCS 302:

PASSWORD OFFICER: Imagine always having your passwords with you, not having to remember them, and never having to type them in. PASSWORD OFFICER generates and stores complex alphanumeric passwords on a smart card, from which they can be transferred by a keystroke or a mouse-click into any application requiring them.

SECURITY OFFICER: Security Officer might have a small footprint (at under 100k), but don't be fooled. Packed into this tiny yet highly sophisticated 32-bit program is a virtual army of 'Security Officers' trained to protect your computer 24 hours a day from Internet-borne viruses, data leakage, the execution of illicit programs and all forms of unauthorized tampering.

NOTES OFFICER: Imagine always having the files that are key to your security and privacy with you, stored reliably and securely on a durable and portable smart card. NOTES OFFICER also allows Lotus Notes users highly increased security by storing vital, normally unprotected ID files containing encryption keys and certificates on smart cards.

TOKEN ID: The security of Windows NT is often questionable, but when used with the smart card technology of TOKEN ID, it can be greatly improved. Among others, features include a secure and consistent way of logging in, workstation locking whenever the smart card is removed.

DATA OFFICER: DATA OFFICER is a brand new hardware based security system which creates a highly secure, protected environment for any PC computer. Offering a complex of functions DATA OFFICER ensures the conditions necessary for the secure and professional use of PC computers. Even under DOS, Windows 3.x or Windows 95, DATA OFFICER allows full anti-virus protection, protection of files and directories, and new security barriers comparable to Windows NT.

We also offer development tools, blank chip cards of various capacities, and we even do printed chip cards in full color.

ABOUT COMPELSON LABS...

Computers were intended to make our lives easier. And in many ways they do. However, as our dependency on them grows, so does the risk of information theft, corruption, and/or destruction.

Today's computers are cheaper and easier to use than ever before, but as they are used to store ever increasing amounts of critical and/or confidential information, the seriousness of the danger from Internet borne viruses, illicit access by unauthorized individuals

either through networked computers or from an unattended workstation, or even accidental deletion of critical files by co-workers or even by oneself, increases immeasurably.

Fortunately, Compelson Labs have produced a line of sophisticated hardware and software products designed specifically to protect your data against the myriad security threats that exist in our computerized world.

SIMEDIT FEATURES

SIMedit! 3.5

"Many great new features!"

- 1. Direct import and export to Excel, Word and other applications**
Using the standard Windows clipboard functions one can now easily transfer all phone-book entries directly from Excel to SIMedit! and back again.
- 2. Diagnostic checking of the SIM card with error repair**
Everyday use of your phone can lead to errors emerging from time to time, resulting in the loss of phone numbers, the shortening of your phone book and other problems. SIMedit! is able to not only detect such errors, but also to repair them, thus re-achieving total functionality in your mobile phone.
- 3. Unblocking card using PUKs**
SIMedit! allows the unblocking of your SIM utilizing automatic detection of whether PUK or PUK2 is required. Number of retries remaining is also indicated.
- 4. Changing of PIN1, PIN2**
You can now enter or change PIN codes directly using SIMedit! Considering that every phone does this slightly differently, being able to use SIMedit! for this purpose is extremely useful.
- 5. Protected mode with Fixed Dialing Numbers**
SIMedit! allows you to define a mobile phone's "protected mode", effectively allowing the phone's "owner" to control which numbers can be dialed by other users of the same phone. This is an especially useful function for restricting calls on company-owned phones or when you allow children access to phones, etc.
- 6. Faster reading of SIM**
SIMedit! increases the speed of SIM reading by implementing cache technology.
- 7. Print your SIM content**
Now you can print your address book and other contents of your SIM.
- 8. Complete SIM back-up**
Now back-up all SIM structures, such as Fixed Dialing Numbers, Preferred Networks, Forbidden Networks, etc.
- 9. Supports all the newest types of SIM cards**
MegaSIM, SIM ToolKit, SIM Phase 2+, STAR SIM, etc.
- 10. Editing of Forbidden Networks List**
SIMedit! now offers a useful function for those who travel. If you travel somewhere where some networks are

inaccessible, your phone will mark them as inaccessible forever, even though they function normally now. Well, SIMedit! can now correct this and other problems.

11. Editing of Preferred Networks List

Like the "Forbidden Network List" above, you may now edit your "Preferred Network List".

12. Editing of long phone numbers

SIMedit! is now able to create and work with numbers longer than 20 digits. This is especially useful for numbers with tone dialing codes, passwords, new selections, and network codes.

13. PCMCIA and a wide variety of readers

SIMedit! is now available with a PCMCIA reader (ideal for notebook users), and is compatible with all PC/SC compliant readers on the market.
