DE·BABELIZER® *Lite*

THE **EZ TO USE** *GRAPHICS TRANSLATOR*™

WHAT IS THE DIFFERENCE BETWEEN DEBABELIZER AND DEBABELIZER LITE?

Lite contains most of the file translation capabilities of DeBabelizer Toolbox in an easy to use program.

Similar to DeBabelizer Toolbox, Lite automatically recognizes over 55 different bit-mapped graphic formats. Cross platform support includes files created by programs on the Macintosh, PC (DOS/Windows), Silicon Graphics, Amiga and other computers and operating systems. It supports most Photoshop (and third party) Acquire, Filter and Export plug-ins.

It _does not_ support animation formats or several other graphic formats currently available with the Toobox program including Interlaced GIF (with or without selectable transparency)

Also _not included_ in DeBabelizer Lite:
> Image editing/processing
> Internal scripting
> Compositing
> Palette manipulation
> Power Macintosh Native Capability

WHAT ABOUT LITE"S TRANSLATION CAPABILITIES?

Translations can be performed to over **55** different cross platform bit-mapped graphic formats. **Picture Icons and Picture Previews** are created automatically for each image saved.

Images can be translated individually or a **whole folder of images** can be translated at one time.

Images can be saved to any bit-depth that the supported format allows. It has unrivaled 24-bit to 8-bit color reduction with no significant loss of color or image quality.

A format's most popular characteristics are used during a translation. For example: When saving a Windows 256 color file to a Mac PICT, it will automatically have white placed at color 0 and black at color 255 in the color palette. (Most Mac programs expect to find them in those positions.)

DOES DEBABELIZER LITE SUPPORT PLUG-INS?

Most Photoshop (and third party) Acquire, Filter and Export plug-ins are fully supported.

With Acquire plug-ins, images can be scanned or digitized directly into DeBabelizer Lite for translation to any format desired. Acquire plug-ins can also be used to read images in formats not currently supported.

Filters may be used to transform images.
Since most filters can only be used on RGB images, if an image contains less than 17 million colors and a filter is chosen, it will automatically be adjusted up to 17 million colors.

Export plug-ins can be used for **outputting to hardware devices** or for saving formats not currently supported.

FOR YOUR INFORMATION:

DeBabelizer Toolbox (*only*) runs on both Power Macintoshes and 680x0 Macintoshes.

DeBabelizer Toolbox and DeBabelizer Lite are System 7x compatible, 32-bit clean, and Macintosh Easy Open savvy.

Supported:
>   Apple Script
>   Drag and drop
>   Drag and drop of multiple images
>   System 7x virtual memory
>   32 bit mode.

Not currently supported:
>   Balloon help
>   Publish
>   Subscribe

They will both work in System 6.0.7 and on old black and white Macs (without Color QuickDraw). This allows these Macintoshes to be used as graphics processing stations.
