

Q: I am having trouble removing an image inserted by reference that I'd added to my nib file. I have no trouble deleting an image inserted when I copying it into the nib file.

A: When you look at the Image suitcase within InterfaceBuilder you can visually determine how an image was added by examining the title. If the title is black, the image was copied into the nib. If the title is grey, the image was added by reference. In order to delete a "copied" image you can select it and delete it either by pressing the Delete/Backspace key or by choosing Delete from the Edit menu. In order to delete a "referenced" image you must remove it via ProjectBuilder even if it was added in InterfaceBuilder.

To delete an image in ProjectBuilder select the Files browser, select Images, select the image you wish to remove and delete by choosing Remove from the Files menu.
