1.1   GUIEnvironment/GUIEnvironment Support Module Guide

```
                         GUIEnvironment

                      Support Module Guide

    ============================================================================

                    © 1994    Carsten Ziegeler
                              Augustin-Wibbelt-Str.7
                              D-33106 Paderborn
                              Germany

    ============================================================================

The GUIEnvironment support module simplifies some handling methods:

    Screen support

    Gadget  support

    Font  support
```

1.2   Screen Support

```
GUIEnvSupport exports some predefined display IDs:

  GES_HiresPalID, GES_HiresID, GES_LoresPalID, GES_LoresID.

Using this instead of the ones defined in graphics, often makes importing
graphics needless.
```

1.3   Gadget Support

GUIEnvSupport offers the GADDESC and the GADOBJS makros which calculate
the tag value for the belonging gadget description tags !

The GEHUpdateEntryGadgetAHook function is a callback hook which can be used
for gadtools entry text gadgets (STRING_KIND, INTEGER_KIND). If you
set the up function to this hook (using the GEG_UpAHook tag), everytime a
IDCMP_GADGETUP message for this gadget arrives, the belonging variable will
get the new value of the gadget !
(But only of course if notification was set for this gadget !)

1.4 Font Support

The TopazAttr() function returns a pointer to an initialized TextAttr
structure for the topaz 8 font !
