

“VAR” Left in Parameters

Sorry about this one, too (I didn't write the thing!). These are handled easily, for the whole file, by setting up Find with “**var**” (var, space) and Replace With with nothing and hitting Command G to find them individually. When you find one leave it there, add the ‘*’ before the variable name it goes to and hit Command G again. Do this from the top, until it wraps, and then Replace All by hitting your Command *. Any other way is slower and more involved.
