

The Interfaces of „makramee“ and „round and round“

„makramee“ and „round and round“ are realtime drawing tools and they look like some „oldschool“ patterns do. These ones now are interactive versions. A lot of structures are available if you have the patience to check them out.

- In both cases the patterns are made of two circular moving structures. That´s why each structure has an adjustable speed. Move them in the same or in opposite direction and check out, what kind of influence and interdependance options of velocity (+/- direction) and structure/drawsteps has.
- The pensize is a well known option for any kind of drawing tool and there is no need to explain.
- The size of both is adjustable in a wide range and this too has a lot of influence how your choosed structure is looking like.
