ToDoList

by Kris Younger, NeXT Systems Engineer

Overview

This example is based on the IXRecordManager class of the Indexing Kit.   It uses the IXRecordManager to store task descriptions for a simple task manager.   To note are the FindPanel and VocabularyControl, which collaborate to support searches against attributes maintained by the IXRecordManager, and DailyBread, which the object stored for each day's activities.

Classes defined in ToDoList

MainDelegate is the application's delegate.   **CalendarView** is a scaleable calendar panel that serves as the focal point of user interaction.   **ListController** manages the activities window.   **DailyBread** is a simple class that carries activity information for one day's activities; it is designed for use with IXRecordManager, as it implements the IXRecordTranscription protocol.   **FindPanel** searches the full text index created by the IXRecordManager.   QueryFieldEditor performs escape completion for the **FindPanel**.   **VocabularyControl** manages the vocabulary panel.
