Module Browser

The Settings panel includes a browser containing the possible screen saver modules.   It looks something like this:
paste.tiff ¬

This browser shows the screen saving modules that are available to BackSpace.   The first entry in this browser is "All";   If all is selected, BackSpace will pick a module at random every time it activates.

BackSpace can have any number of screen saver modules, and it will search in

> **~/Library/BackSpaceViews**,
> its "app wrapper" folder
> **/LocalLibrary/BackSpaceViews**

(in that order) for all .BackO and .BackModule files containing compiled View objects to be used as screen saver modules.   A .BackModule file

is simply a folder containing a .BackO module, and possibly some related files.   A .BackO module is a normal object file, but it must obey a certain protocol;   see the included file **README.rtf** for more information on writing screen saver modules.   A few modules are also built into the BackSpace application.
