109620_TMSLedgerElement.tiff ↗ Introduction to Guides

OneVision offers two types of guide elements: lines and grids. Guide elements are different than other OneVision elements; for example, they cannot be selected.

Only the guide elements of a currently selected group are visible. If the selected group doesn't contain guides, you'll see the guides of the group that is one level higher.

All guide elements can temporarily be magnetized. You create and move OneVision elements using the left mouse button, and when you press the *Command* key at the same time, all guides are temporarily demagnetized. Pressing both the *Command* and *Ctrl* keys magnetizes the guides only until you release the keys.

Detailed information about different types of guides can be found in the following chapters:
