Quit OneVision

757512_paste.tiff ¬

This command is used for shutting down OneVision.

If there are open documents when the quit command is given, they will be closed automatically. If one or more of these documents contain unsaved data, a panel will appear allowing you to save the changes.

Only quit OneVision when your work is finished and you are sure not going to need it anymore during your working session.

If you want to work with another application and don't want to see all of OneVision's open windows, you can clear the screen using the <*Hide*> command. For more information about this command refer to <Hide OneVision> (;Hide.rtfd;;¬) in the OneVision Manual or <*Hide*> in the NEXTSTEP User's Guide.

Note: OneVision elements that have been copied to the pasteboard for pasting them into documents of other applications are converted to EPS format at runtime. After quiting OneVision naturally can't do this conversion anymore. Therefore, if OneVision elements are in the pasteboard when quiting OneVision, you are asked whether you want them to be converted before quiting. Beware, depending on the elements in the pasteboard, this conversion can cause a huge amount of data that might harm your system.
