941265_SoundElement.tiff ↗ Sound

Sound elements allow you to integrate spoken words into OneVision documents. Sound elements are designed for leaving verbal notes within document. For written notes, each page of a document also offers a special text window.

SoundTool1.tiff ↗ Sound Tool

Sound elements are represented in OneVision documents by black circles. You can group sound elements just like any other element, connecting them to a page, a text element, or a graphic element.

paste_11.tiff ↗

Figure: A Sound element, as it appears on a page

Whenever a document, page, or object group containing a sound element is entered, the sound element will be played.

The following panel is used for working with sound elements:

paste.tiff ↵

Figure: The Sound element panel.

;-Lade;-Load

This command allows you to load pre-recorded sounds into the element. When you click *<Load>*, a browser will appear, in which you choose the sound file you would like to be loaded into the element.

Play, Stop, Pause, Record

These commands work like those on a tape recorder. *<Play>* allows you to listen to the recorded message, *<Record>* enables you to record a message through your computer's internal microphone, *<Pause>* lets you interrupt the recording or playback, and *<Stop>* ends the recording or playback of the message.

For more information on this panel, see the *<Mail Commands - Lip Service>* chapter of your NeXT User's Reference.
