## Print Parameters Menu

The Print Parameters tool is an extension to OneVision. It automatically connects itself to the *Printing* menu, in the form of the submenu named *Print Parameters*. It is used for defining the parameters for printing documents, creating register marks, creating separations, and controlling halftone imaging.

Information on how to set the various printing parameters (such as transfer curve, frequency, screen angle, screen ruling and spot function) is included in the following chapters.

Basic information about color separations can be found in the chapter entitled <Separation Basics and Transfer Curves> (<;\..\..\..\TMSSep/TMSSepBasics.rtfd;;;->).
