0b815f5f84012584067f411b312d37OneVision: Introduction to Working ±
Colors from Images

paste.tiff ↪ **Colors from Images**

Clicking this icon in the color selection panel enables you to select colors from an image.

You can use any image as a source for selecting colors. Please refer to your NEXTSTEP User's Reference for a description of using images as palettes. Additional information on this topic can be found in the electronic manual of the [®]Edit[®] application (chapter <Working with Color>).

16295_paste.tiff ↪ *Figure: The portion of the Color Selection panel for selecting colors, in this case from the default spectrum image*

In the pop-up list that appears above the image window, you can choose among currently loaded images that can be used as color palettes. A spectrum is loaded as a default image.

The pull-down list <Palette< contains commands for handling the image files and palettes.

The chosen color will automatically appear in the color well. Using *Drag-and-Drop*, you can move it from there to a OneVision

panel. If the color well icon in that panel is activated (displaying a white frame), the changes you make to a color will be automatically transferred there.
