## Assign Masterpages

885442\_paste.tiff ↵345812\_paste.tiff ↵paste.tiff ↵

The *<Assign>* menu command enables you to establish connections between a selected masterpage and one or more documentpages. A panel appears listing all available masterpages in its upper part.

423907\_paste.tiff ↵

You can select the masterpage from the list you want to assign. Clicking the *<Goto>* button causes the selected page to be displayed in the document window.

In the lower part of the panel you can determine to which documentpages you want to assign the selected masterpage.

82753\_paste.tiff ↵

You enter the numbers of the first and the last page to which you want to assign the selected masterpage in the two text fields. You can also type only *</>* (for last).

If the option *<All>* from the radio buttons is selected, the masterpage will be valid for all documentpages within the range you've specified. The options *<Odd Pages>* and *<Even Pages>* can be used for changing the valid masterpage dynamically, depending

on the page number. Because, each documentpage may be assigned two masterpages, one for even pages and one for odd pages. So, if a page bears an even page number, the masterpage for even pages is valid. If the page's number changes to an odd one, because a page has been added before it, the masterpage for odd number becomes valid. This makes it easy to create documents with different page layouts for even and odd pages.

If you assign a masterpage to a documentpage that has already been assigned one, this previous assignment is automatically released. In the preferences to masterpages (`;/../Info/Preferences.rtf;Musterseiten;↵`) you can specify whether to remove or convert masterpage link elements, i.e. elements that appear on a documentpage because of an assigned masterpage.

Clicking the `<OK>` button will assign the masterpage. If you click the `<Cancel>` button, no pages will be assigned.
