0b815f5f84012584067f411b312d37OneVision: Edit ± Paste

## Paste

712103\_paste.tiff ↵

The *<Paste>* command is used for inserting into your documents data that you have cut or copied from OneVision or another application.

The pasted data will appear exactly in the position it was cut from or, if copied, slightly to the right and below the element from which it was copied.

If you are not in edit mode, pasting always creates a new element containing the cut or copied material.

If you are in the edit mode and nothing within the current element is selected, the paste operation will try to insert the copied or cut

material into the element. If a portion of the element is selected, that portion will be replaced by the pasted material.

If the material to be pasted consists of data in multiple formats (for instance, text plus an image), a panel will appear, asking you to select a server for importing the data :
