Export to File

745696_paste.tiff ¬323778_paste.tiff ¬

This menu command enables you to export selected elements, the current page, or several pages to a different file formats.

This tool is not automatically loaded, so it may not appear in the menu. You can load it using the Module Controller (;../Info/ModuleController.rtfd;Modul laden;¬).

A radio button lets you choose among the following options for exporting data:

Selected Elements
All selected elements will be exported. A bounding box is drawn around these elements and the enclosed area is saved in a file in the selected format. This option is only enabled if elements are selected.

Current Page
The current page will be exported saving the whole page in a file in the selected format.

Pages
All pages in the range, defined by the *<From>* and *<To>* fields, will be exported. The file formats offered for export can not store more than one page in a single file. Therefore, a directory will be created that contains every page as a single file in the selected format.

File Formats
You can select the file format for the data you want to export in a pop-up list. Depending on your selection different options and parameters controlling the export are displayed:

The following file formats are currently available:
- **EPS** (see EPS Export ;../../../EPSExport/EPSExport.rtfd;;¬)
- **TIFF** (see TIFF Export ;../../../OVTiffExport/OVTiffExport.rtfd;;¬)

Export
This command opens a file selection panel in which you can define the name of the file to which you want to export your data. If you are exporting more pages, a ªdº is added to the default extensions ªtiffº or ªepsº indicating that a directory will be created in which each page is saved as a TIFF- or EPS file.

Cancel
This cancels the data export.
