Print Parameters for Documents and Elements

The print and separation parameters created with the tools Curve Calculation (;../TMSPrintParameterGenerator/TMSPrintParameterGenerator.rtfd;;¬) and Rendering (;../TMSPrintParameterGenerator/TMSPrintParameterGenerator2.rtfd;;¬) can be set for each document as well as for each element of a document. From the *Print Parameters* menu in OneVision's *Printing* menu, you can choose whether you want to set parameters for the current document or for a selected element.

Document
paste.tiff ¬With this command you may define print parameters for the current document. These parameters are valid for all elements in the document for which no individual print parameters are specified.

Element
21032_paste.tiff ¬The *<Element>* menu item lets you define the print parameters for the selected element or group. (Everything said about elements in this chapter is also valid for groups.) Only one element may be selected. If more elements are activated, the following menu commands are not executable

<Document> and *<Element>* open submenus in which you can create, modify, and remove print parameters.

New
This command creates a print parameters entry for the current document or selected element and opens the *Separation and*

Print Parameters panel (;../TMSSep/TMSSep.rtfd;;¬). This command is only enabled if no entry already exists.

Modify
Clicking this command displays the *Separation and Print Parameters* panel (;../TMSSep/TMSSep.rtfd;;¬), which shows the print parameters for the current document or selected element. This command is only enabled if a print parameters entry already exists.

Remove
This removes the print parameters entry for the current document or selected element. When removing the print parameters for an element, the parameters for the document take their place. Removing the entry for a document activates OneVision's default parameters.
