Register Mark

There is no industry-standard register mark, so the default ªRegister Markº shape can be varied in several ways.

You create the register mark element by dragging an element frame.

To get a register mark like the one below, set the *<Cross Hair Weight>* to zero, switch the *<Fill>* option off, the *<Outline>* option on, and set the line weight in the Line Style Editor (;../OneVision/WorkingIntro/TMSStrokeAttributesWell.rtfd;;¬) to 0.012 inch.
paste.tiff ¬
Enabling the *<Fill>* option, switching off *<Outline>*, and setting line weight to 0.016 inch creates a register mark like this:
981056_paste.tiff ¬
Note: Don't confound the parameter *<Cross Hair Weight>* that refers to the thickness of the horizontal and vertical bars with the line weight you can set in the Line Style Editor. The latter refers to the lines of which the cross hair consist.
