PageInfoElement.tiff ¬ **Sheet Info**

The module Sheet Info allows you to place special text elements on your page being printed on each plate and holding different kind of information about the document and the printing process.

PageInfoTool1.tiff ¬ **Sheet Info Element**

For creating a Sheet Info element you don't have to drag an element frame. It is sufficient to change to ªNew Elementº mode and click once in your page. A line of text will be created holding all the information you've opted for by checking the corresponding buttons in the *Sheet Info* panel.

Options for the following information are available:
- Document Name
- Page Number
- Plate
- RIP Time
- Date
- Time
- User

The correct values for variable information such as *<Date>*, *<Plate>* or *<RIP Time>* will automatically be updated at printing.

The information <*User*> displays the name that has been entered in the *Send License Form* panel (*;../OneVision/MainMenu/Info/Licensing.rtfd;markervonBogenInfo;¬*) in the field <*Name*>. If nothing is entered there, the login name of the current user will be used.

You can add or remove information to/from a selected Sheet Info element by checking or unchecking the corresponding button. One piece of information must remain, though, because you can not have an empty element. If you create a Sheet Info element with all options being off, the last checked option will be activated automatically.

You can move Sheet Info elements on your page, but you can not change their size. Their dimensions depend on the information they hold and the font you are using. If you want to change the font size, activate the Sheet Info element and select the font you like from the *Font* panel. The *Font* Panel can be opened from the *Format/Font* menu or by pressing *Alt-t*.
