

XAmode (c)1993 KNOPS EDV-Anlagen Gerd Knops, Germany

This program enables you to read PHOTO-CDs with a TOSHIBA CD-ROM
(This program is not required for the Type 3501)

Usage:

```
XAmode -t#
```

where # is a substitution for the device address (0..6) of the CD-ROM drive

This program must be executed with superuser right. Therefore you must be logged in as "root" when launching it.

XAmode can be executed immediately before reading a Photo-CD or automatically when starting up your computer.

Follow these steps:

1. Log in as "root".
2. If the folder */usr/local/bin* doesn't exist yet, create it.
3. Copy the program "XAmode" to */usr/local/bin*
4. Add the following line at the end of the file */etc/rc.local* (This line is only necessary if you want XAmode to be loaded automatically each time you start your computer.)

```
/usr/local/bin/XAmode -t#
```

where # is a substitution for the device address (0..6) of the CD-ROM drive

Note: It might happen that the SCSI devices are reinitialized during a work session (e.g. if there are errors when reading from the harddisk). If this happens, you must execute XAmode again.
