Chapter 1

Compendium Deluxe #1 File Packers Menu

1.1 File Packers

Filename	Comands	Size	Description
byte205.lha	VX	4K	Bytekiller 2.05 update by Cath of LSD - This is an updated version of Lord Blitters cruncher ByteKiller.
cdt-cp10.lha	VX	3K	Cop-Pack 1.0, 1994 by Copkiller of Coldcut! This is a new cruncher like Defjam-Packer or any binary address cruncher. It's much faster than most other ones, try it!
chs_crun.lha	VX	10K	CHRYSEIS CRUNCHER V0.9 - Titanic is old, Titanic is sloooooow (almost 30' to crunch a 1.7 mb demo on my a3000), Titanic is inefficient. So here is the Chryseis cruncher: Chryseis is new, Chryseis is damn fast, Chryseis is the most efficient, Cryseis decrunchs while loading!
crmav19t.lha	VX	148K	Crunch-Mania 1.9 - 08.10.93 by Thomas Schwarz - This is probably the BEST file/data cruncher available on th Amiga, beats the hell out of Powerpacker! Has dozens of options and handles system and pro crunching. Check it out!
dcr_v1_1.lha	VX	22K	Decrunch v1.1 - Basically 'Decrunch' decrunches files, it handles many differant crunchers.
i-pph208.lha	VX	29K	ProPack V2.08, Modified by Industrial Light & Magic - This Programm Has 2 Options To Protect The Outputfiles From Beeing Unpacked By An Unauthorized Person, you can either Lock a file or Lock With A Keyword.
packit11.lha	VX	13K	PackIt v37.110, Release 1.1 by Michael Barsoom - PackIt is yet another shell only Data file PowerPacker cruncher/decruncher. Features includ One program for crunching and decrunching, Will not crunch executables unless told to do so, allows use of wildcards, plus many others.

pdata210.lha	VX	157K PowerData, Version 38.210, by Michael Berg - Not only does this program enable all applications to read files compressed with Powerpacker, it also makes applications compress the files they create themselves, using the very same PowerPacker algorithm. PowerData is implemented as a patch so it is completely transparent.
ppcount.lha	VX	3K PPCount 1.0 by Shagratt/LSD - Ever wanted to know the unpacked length of a directory of powerpacked files without unpacking each file and writing the all the lengths down, and adding them up? This CLI utility is the answer. It also works on individual files.
pplib16.lha	VX	83K Powerpacker.library V36 (1.6) by Nico François - Several people suggested the development of a library to help programs decrunch files crunched with PowerPacker, and that is exactly what this is. This library tries to make it very easy to support PowerPacked files. It is a standard Amiga shared, runtime library.
qpp-pp.lha	VX	5K QPP 1.0 by Synthetic/RSL. QPP is a program that patches PowerPacker 4.0a - crunched objectfiles for faster decrunching (30%- 40%!). The original decrunch-header is replaced by a faster one - which is about 198 bytes longer than the old one.
stomcru2.lha	VX	91K Storm Amos Cruncher 2.0b by Ejber Ozkan - This will let you crunch any file into a much smaller file and when you need to use that file again you can decrunch it using this program again. This program bears a remarkable resemblance to power packer, but is written in Amos!
stonecracker.lha	VX	147K StoneCracker v4.10.2 pro and Stc.library v3.303 by Jouni 'Mr.Spiv' Korhonen - Stc is an executable/data/absolute file cruncher, it was designed to fulfil my own needs and includes those features I think useful. The algorithm used in Stc is called S404. Some LZ variant I think, but entirely developed by me.
ulib3840.lha	VX	69K Unpack.library 38.40 a new file decruncher, now knows more than 130 different cruncher types, includes DMS and Lha.
