[Commands](#)

[Troubleshooting](#)

Configuring the BigFocus 13 / Win Driver

A few parameters that control the use of BigFocus with AutoCAD can be set in the DIAMOND BigFocus Configuration window. To display this window, select Options from the AutoCAD main menu, then Configure. Next, choose item #3 from the menu to configure the video display. Choose BigFocus. A prompt will appear: "Do you want to configure the BigFocus .. driver?" Choose Yes

The settings available in this window are described below:

Smart redraw:

When this checkbox is activated, an optimized redraw is performed whereby only the so-called "dirty areas" are redrawn.

BigFocus menu:

This setting determines whether the BigFocus menu will be displayed when AutoCAD is restarted.

About BigFocus:

Displays version and copyright information about your version of BigFocus.

#SPEAHELP Call online help
#WRDRW Bird's-Eye redraw
#ZA Zoom all
#ZI Zoom index
#ZN Zoom next
#ZP Zoom previous

SYSTEM CONFIGURATION INFORMATION

BigFocus 13/Win is designed exclusively for the following Windows accelerator graphics boards:

- Mercury series
- Fire GL series
- Stealth 3D series
- V7 Storm Pro

A Note about System Memory and the Windows permanent swap file

Both Windows and AutoCAD for Windows each require a lot of system memory to be able to run the system at an acceptable speed. Please read the corresponding sections of the AutoCAD documentation!

Toolbar

Call

- click on the toolbar icon in the AutoCAD icon menu bar:

- or: start the toolbar from the AutoCAD menu, option 'BigFocus'. This is only possible if the BigFocus menu checkbox in the BigFocus Configuration dialog is activated.

Zoom All [#ZA]

Executes a DIAMOND Zoom All command, zooming to view the current maximum Bird's-Eye dimensions.

Zoom Index [#ZI]

Executes the zoom index command. This command can be used to zoom the display using the views stored in the zoom stack. Its function corresponds to clicking on one of the zoom stack buttons in the Bird's Eye window.

Syntax: **#ZI_x**, where x is between 0 and 7. The value of x specifies which zoom view should be displayed.

Zoom Next [#ZN]

Displays the next view in the zoom stack; this corresponds to clicking on the next button to the right of the currently active view in the zoom stack.

Zoom Previous [#ZP]

Displays the previous view in the zoom stack; this corresponds to clicking on the next button to the left of the currently active view in the zoom stack.

Zoom Window [TB_ZOOM_WINDOW]

Executes the AutoCAD 'ZOOM WINDOW' command.

Redraw [_REDRAW]

Redraws the screen contents (executes the AutoCAD 'REDRAW' command).

SPEACONFIG [#SPEACONFIG]

Calls the Hotkey configuration dialog box. See also: [Hotkeys](#)

HELP [#HELP]

Starts this BigFocus online help file.

BIGFOCUS 13/WIN HOTKEY DEFINITIONS

To open the BigFocus Hotkeys configuration dialogue box enter the command: #SPEACONFIG or click on the HOTKEYS CONFIGURATION button of the [main menu](#)

Assigning a Function to a Hotkey

Assign commands to function keys and key combinations with function keys using this menu.

Note

Some function keys are reserved by AutoCAD and Windows. A warning message is reported on the screen if you select a reserved key combination. However, if you assign a new command to a reserved key combination, any previously assigned AutoCAD or Windows function is no longer available.

See [Hotkey Defaults](#) for information on reserved assignments.

Example: Assigning the command #ZA to F3

1. In the `Shift Keys` section mark the `None` checkbox.
2. In the `Function Keys` section mark the `F3` checkbox.
3. Type in the command **#ZA** in the input box next to `Command`.
4. Click on `OK`.

The function is now programmed to F3.

Proceed in the same way to assign a command to any other key combination.

Notes

Before clicking on `OK`, assign all hotkey combinations you want to define. Clicking `Cancel` will delete all hotkey combinations defined so far.

The `Command` input box displays the assigned function when the corresponding key combination is selected again from the menu.

Function Button Description

- `Show all`

Lists all the existing hotkey assignments. You may select one or more assignments and delete them with the `Clear` button.

Note: The `Clear` button is enabled only when a hotkey assignment is selected.

- **Cancel**
Restores the hotkey assignments to the state that existed before the configuration menu was called.

Changing a Hotkey Assignment

Assign a new function to the respective key combination. This will overwrite the previous assignment.

Deleting a Hotkey Assignment

1. Select the function key combination required.
2. Press the BACKSPACE key or delete the entry in the `Command` input box.
3. Click on `OK`.

or

1. Click the `Show all` button.
2. Select the hotkey assignment you want to delete
3. Click the `Clear` button.

The assignment is now deleted (check with `Show all`).

F11	-	-	-	-
F12	-	-	-	-

BIRD'S-EYE VIEW

Purpose

The Bird's-Eye View is a useful tool that shows you the entire drawing regardless of a current zoom view. It serves to help you find your way around complex drawings by showing you the zoom area as a box. It also allows quick definition of zoom areas and enables you to pan these.

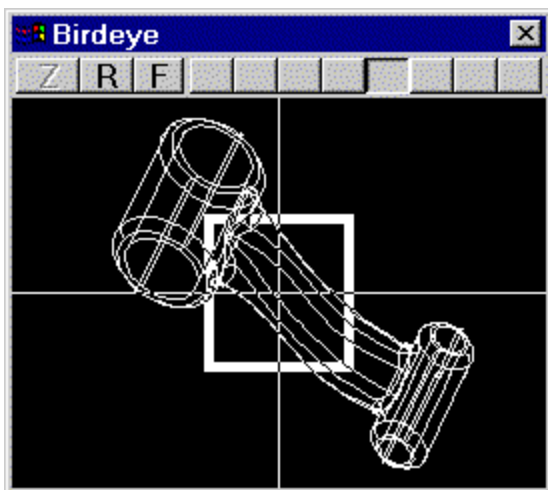

Call

Enter the command #BEPOP, or click on the "globe" icon symbol in the main Toolbar:

Button Description

Click on the area of the menu for which you require online help.

Defining a Zoom Window within the Bird's-Eye View

1. Position the cursor over the imaginary top left corner of the intended zoom window.
2. Press and hold the right mouse button, then move the mouse to draw open a zoom area box. Note that if you also hold the left mouse button the view in the main area is dynamically changed too.
3. Release the button to see the zoom view on the main screen. Note that the zoom area is now shown as a box in the Bird's-Eye.

If the zoom view does not cover the area you want correctly, simply repeat the process.

Moving a Zoom Window in the Bird's-Eye View

1. Move the cursor within the zoom area box in the Bird's-Eye View.
2. Press and hold the left mouse button. A new outline now appears (the old area is left on the screen) and can be moved with the mouse.
3. Release the mouse button to see the new zoom view and delete the old outline.

Note

To move the zoom view dynamically press and hold the left mouse button, and then press and hold the right one before moving the zoom box. The main view is then dynamically changed.

Panning in X or Y Directions within the Bird's-Eye

1. Click and hold the left mouse button to the left or right of the zoom area box and move the mouse to pan vertically only
2. Click and hold the left mouse button above or below the zoom area box to pan horizontally only

Redrawing the Bird's-Eye Window

The #WRDRW command updates and redraws the Bird's-Eye View. This may be necessary when vectors are deleted from a drawing. The Bird's-Eye View may still contain these deleted vectors or sections, whilst the drawing itself is displayed correctly in the display area.

Syntax

#WRDRW

Zoom Status

Indicates that zooming is possible. The 'Z' changes to 'NZ' (on a red background when zooming is not possible). This can occur in Paper Space mode in perspective view. To correct this, change the Paper Space mode to Model Space and then execute the zoom. 'NA' indicates that the view is not the current one and that a zoom is therefore not possible. This can occur if you are working with more than 4 viewports. The driver can only maintain a limited number of viewports/Bird's-Eye views simultaneously. To correct this, make the required viewport the current one by clicking on the 'NA' symbol.

Zoom Stack Buttons

These 8 buttons to the right of the 'F' button represent 8 zoom views stored in the zoom stack. Each time you zoom into the drawing the view is saved onto the next zoom button (it appears to be pressed down). To skip through various zoom views from the stack, simply click on the blank zoom buttons in turn.

Redraw Button

This button enables you to quickly redraw the Bird's-Eye window contents after moving, copying and deleting elements in the main drawing, removing any pixel artifacts which may disturb you.

Note: If you use the Zoom All command, it affects the zoom view that results from clicking on the Fit button.

Fit Button

Expands the current zoom box to fill the Bird's Eye window. To return to a normal view after using any of the buttons in the Bird's Eye window, click with the left mouse button anywhere within the Bird's Eye view.

Note: After you use the Fit button, a Zoom All command will zoom back to the view defined by the preceding Fit commands.

SPYGLASS LENS

The Spyglass Lens is a useful magnifying glass tool used to examine a particular area of your model that you want to work in. It can also be used to pass the zoomed view back to the AutoCAD drawing area and Bird's-Eye view.

Syntax #LEPOP

Alternative: Click on the following icon in the Toolbar:

Example of a zoomed view in the Spyglass lens:

Using the Lens Window

1. Open the Lens window.
2. Use the slider bar to set a magnifying factor as required (e.g. 15). Click on the scroll bar to change by a factor of one-half or two.
3. Click in the drawing area again
4. Press and hold the CTRL key. The area beneath the current cursor position is now shown in the Lens window (moves dynamically with the cursor in the main drawing) at the zoom level shown in the top bar of the Spyglass Lens.
5. Release the CTRL key to end the dynamic Lens function.

Passing the view back to AutoCAD

To pass the magnified view in the Lens window back to the main drawing: proceed as above, but click the left mouse button once **before** releasing the CTRL key. The lens view is then passed back to the main drawing view.

Lens Zoom Factor

The zoom factor number in the lens is multiplied by the current zoom level to get the resultant viewing zoom level. For example, if you are at zoom level 10 and the zoom factor in the lens is 4 then you will be viewing your model at zoom level 40 in the lens.

#BEPOP (TOGGLE BIRD'S EYE VIEW)

The #BEPOP command toggles the Bird's-Eye View ON/OFF.

Syntax #BEPOP

Note

This function is most useful when assigned to a hotkey.

Troubleshooting

Problem:

During the AutoCAD Video Display configuration, the option 'BigFocus - Accelerated Display Driver...' doesn't appear, and the Toolbar doesn't appear.

Solution:

Check your ACAD.INI file. It must contain the following section (example):

```
[General]
....
ACAD=c:\acadr13\win;....;c:\diamond\bf13win
ACADDRV=c:\acadr13\win\drv;c:\acadr13\win;c:\diamond\bf13win
....
```

whereby the first path (C:\DIAMOND\BF13WIN in this example) should correspond to the target directory you specified during the BigFocus software installation. The second path (C:\ACADR13\WIN in this example) should correspond to the AutoCAD executable directory. Change or add these entries if necessary.

Problem:

The 'BigFocus' pulldown menu is still present after reconfiguring to another driver. It doesn't function but causes a number of error reports on the screen.

Solution:

Restart AutoCAD. The pulldown menu will then have disappeared.

Problem:

The BigFocus pulldown menu is disturbing.

Solution:

Deactivate the BigFocus menu checkbox in the DIAMOND BigFocus Configuration window. The menu will disappear the next time you start AutoCAD.
