FAQ

Is there a Macintosh, OS/2, 16-bit Windows or Linux version of HTMLtool ?

No, I am sorry, there is not. And since the tool I use for software development is not available on any other platform than 32-bit Windows, versions for other systems are very unlikely to be written.

My frames show up in Microsoft Internet Explorer, but not in Netscape.

Make sure your frames don't come after the <BODY> tag - when used with frames, the <BODY> tag should only appear in the <NOFRAMES> section.   Netscape has been stricter about this in the past, but future version of Internet Explorer will also require that your frames don't come after the <BODY> tag.

I use an HTML syntax checker on my documents, and it generates a list of line numbers where errors occur.   How do I quickly move to these line numbers in HTMLtool ?

Just press Ctrl-G and enter the number of the line you want to jump to in the dialog.

Why do you force people to use Internet Explorer as the internal browser? I want to use Netscape as the internal browser, and I don't like my other software to take sides in the browser war.

I try not to take a position in this issue. The reason why I use Microsoft Internet Explorer (MSIE) is simply because it works. MSIE includes a browser "object" that can be used inside of other applications, whereas Netscape does not - in other words, it's not possible for me to use the Navigator inside of my software.

I'm using Internet Explorer as the internal browser, and it's shifted over to the right, or it doesn't appear to resize correctly.

This problem will occur if you use the original release of IE 3.0 as the internal browser. You need to use IE 3.01 or later to correct this.

When I try to browse a file, Internet Explorer prompts me to save the file to disk.

In order to view some types of documents with Internet Explorer, you need to assign a MIME type to them. Here's how you do this:

Open Windows Explorer.
From the menu select View--Options.
Click on the "File Types" tab.
Scroll down the registered file types until you find the entry for the file type you want to view. Select it.
At the bottom you see extensions, content type (MIME), and "Opens With." To view the file within HomeSite or Cold Fusion Studio, the file must have a MIME type of "text/html" or "text/plain".
If the MIME type is not set, click on the EDIT button.
In the "Content Type" pick-list, choose a MIME type (text/html should be fine).
In the "Default extension for content type" pick-list, either choose the extension appropriate for this file or type it in.
Click OK to save the changes.
What you are doing is telling MSIE how to interpret the file when it tries to display it. If there is no MIME type defined, then MSIE will ask you if you want to open it using the defined "open with" application,

which results in the error being displayed.

I'm using a <BGSOUND> or <MARQUEE> tag, and although it shows up fine in Internet Explorer, it doesn't show up in Netscape.

<BGSOUND> and <MARQUEE> are specific to Internet Explorer - they're extensions to HTML that Microsoft added to their browser. They won't work in any other browser.

I uploaded my page to my web server, but none of the images show up.

For the images to display, you have to upload them to your web server as well. If you've done this, then you also have to make sure that the paths specified in your <IMG> tags matches the paths on the server.

Export

You can export your HTML to various formats in HTMLtool:

Save as UNIX format
> will save your HTML in UNIX format

Save as Macintosh format
> will save your HTML in Macintosh format

Save as JavaScript
> will generate a JavaScript function that returns the original HTML code

Save as Perl
> will generate a Perl function that returns the original HTML code

Save as C
> will generate a C CGI function that returns the original HTML code

Snippets

The snippets system in HTMLtool allows you to save often-used pieces of HTML code as 'snippets' which you then can insert into your documents with a double click.

How to create snippets
There are two possible ways to create snippets:
1. Write something into an open document, select it and choose **Save selection as snippet** from the **File** menu. This will open the snippets dialog and insert the selected text as the opening tag.
2. Select the snippets tab from the PowerPanel, click with the right mouse button and choose **Add**. This will also bring up the snippets dialog.

How to delete/edit snippets
To edit or delete a snippet, just open the context menu of the snippets box and choose the appropriate menu item.

How to insert a snippet
To insert a snippet into the current document, just double click on an entry in the appropriate entry inbox of the PowerPanel.

Templates

How to create new files from templates
To create a new document based on a template, simply choose **New** from the **File** menu and choose the template you want to use from the list in the dialog.

How to create new templates
To create a new template, open a document, enter the text you want to use as a template and then choose **Make template from file** from the **File** menu. A message will confirm that the template has been created.

Project Assistant

What a HTMLtool project is
A HTMLtool project is a list of HTML files that belong together (e.g. a website). It does not include those pages but only contains their paths and filenames. It does not contain images or other linked resources.

How to create a new project
Choose **File - Project - New** to open the Project Assistant. If it already was open, a message will ask whether you would like to save the work on the last project, before opening a new project.

How to load a saved project
Choose **File - Project - Open** to open the Project Assistant and load the project into it. If it already was open, a message will ask you whether you would like to save the work on the last project, prior to opening and loading the next project.

PowerPanel

The PowerPanel is a facility that contains several useful tools: The Filer, the documents box, the snippets box and the internal previewer.

How to show/hide the PowerPanel
To toggle the PowerPanel simply choose **Tools - PowerPanel** or click the PowerPanel speedbutton.

Filer

Documents box
The documents box shows a list of all open documents. To make one of them the active document, simply double click on the appropriate entry in the documents box.

Snippets box

Internal Previewer

Scripts box

Internal Previewer

If you have Internet Explorer 3.1 or higher installed on your system, it can be used as your internal previewer. It will be automatically recognized by HTMLtool.

How to use it
To update the preview, choose **View - Update internal previewer** or press F5.

How to disable it
To disable the internal previewer (e.g. because you receive OLE errors), simply go to the Options screen.

Why you cannot use Netscape Navigator as the internal previewer
While Microsoft distributes its Internet Explorer as an OLE control that can be embedded in other software (eg. HTMLtool), Netscape does not offer this possibility. You can however use   Netscape Navigator as external previewer, including DDE support.

Filer

The Filer is like a 'mini-explorer' directly included in HTMLtool.
You can drag and drop files from the Filer onto an open document and it will insert tags according to the file type. If not specified in a different way (see the Options screen), a file with the extension GIF will cause the insertion of a <IMG> tag while unknown file types will be linked to with the <A> tag.

How to update the Filer
To update the directory structure and files shown in the Filer click right on the Filer button or choose **Refresh** from any of the Filer context menus.

Local Link Checker

The Local link checker is a tool that looks for broken links and image tags in your HTML documents. It will ignore internal links and links that point to resources on the web.
Click the Rescan button to update the list of links. If a broken link is found it will be marked 'Broken' in the result box. All valid links will be marked OK.

How to open the Local link checker
Choose **Tools - Local link checker** to bring up the link checker window. To check another file, open it or make it the active document and click **Rescan** on the link checker window.

File Weight

The file weight feature of HTMLtool reads all dependencies such as images and sound files from an HTML document and then calculates the time it takes to download this page with all linked stuff (no links to other HTML pages) from the web.

How to open the File Weight tool
Simply choose **Tools - File Weight** from the main menu or **File Weight** from every document context menu.

To only check if all linked local resources are available, use the [Local link checker](#).

Convert text

The text conversion feature of HTMLtool allows you to turn a formatted plain text file into an HTML coded file quickly.
First specify which file you would like to convert. Note that this file will NOT be modified but the resulting conversion will be shown in a new text window. You can specify several conversion options such as the use of the <PRE> tag.
Umlauts and other special characters will automatically be converted into their HTML code equivalents.

User defined tags

Since HTML is constantly being expanded with additions being added, it is necessary for the users to be able to create his/her own tags. HTMLtool offers this feature.

How to create a user defined tag
Choose **Tools - User defined tags** to create/delete/edit your tags. The text specified as Opening tag will be inserted in front of the caret or selection, the text specified as Closing tag behind it upon insertion.

How to insert a user defined tag
The user defined tags will show up in the Tag list and in the drop down list on the Tags tab of the speedbar.

Tag list

To make it easy for you to insert tags into HTML documents, HTMLtool offers the Tag list. It is divided into six tabs which feature standard tags, standard attributes, the user defined tags, ASP tags, WebTV tags and attributes and Cold Fusion tags. To insert one of the tags, simply double click on its entry in one of the boxes.
The edit box above the tag lists will complete the tag you enter after pressing Enter. For example, if you enter <HT, it will be automatically completed to <HTML>..</HTML> will be inserted into the current document after you press Enter then.

All tag data is saved in .dat files.

.dat files

The .dat files in the /Data subdirectory contain almost all the HTML specific information of HTMLtool, e.g the TagComplete data, the user defined tags, the possible document type informations and snippets data. You can edit this information with any text editor (also with HTMLtool), but you are cautioned to make backup copies, in the event you make a mistake and need to recover the original .dat file.

Uninstalling HTMLtool

Uninstalling Lorenz Graf's HTMLtool is quite simple - just go into Control Panel, double-click on 'Add/Remove Programs,' then double-click on the 'Lorenz Graf's HTMLtool 2.0 DEMO' entry.

Note: Because HTMLtool stores data such as personal preferences and settings in the registry, not all HTMLtool registry entries are removed by the uninstall program.   If you're sure you wish to remove these entries, use REGEDIT.EXE and delete the key 'HKEY_CURRENT_USER\Software\Lorenz Graf's HTMLtool'.
After using the automatic uninstall function, some files like full text indices of the windows help may remain on your harddisk.

HTMLtool and Windows NT

HTMLtool was developed on a Windows 95 workstation and was not fully tested on NT machines. Though no problems with Windows NT were reported by users, at this time no support can be given for Windows NT specific problems.

Get the full version

Buy the full version of HTMLtool to get rid of the nag-screens and to receive support via e-mail. The price of a single copy is **US $15**.

You can order in different ways:

via Internet:

Please point your favorite Internet browser to http://www.shareit.com/programs/101432.htm

via phone:

US customers: To order via phone, please call the toll-free number 1-800-903-4152.

Other customers: Please call   +49-221-2407279 (Germany)

The product ID for HTMLtool is **101432**

via mail/fax:

Germany, Austria and German-speaking Switzerland
US and rest of the world

After registering you will receive a registration code to unlock the full version by e-mail.

For information on volume discounts, please e-mail me at HTMLtool@poboxes.com.
Note: Pricing information is subject to change. Please check my web site for the latest pricing information. Thank you.

Technical Support

There is no technical support via e-mail for the demo version.

So please check if your question or concern is addressed in one of these places:

- The Frequently Asked Questions section of this help file
- The HTMLtool homepage on the world wide web (http://www.poboxes.com/HTMLtool)
- Other documentation supplied with this release.

There is no e-mail support for users of the DEMO version.

Features

Here are some of the coolest features of HTMLtool:

Dialogs for insertion of tags
There's a dialog for almost every HTML tag. This really makes HTML coding easier.

Right click tag editing
Right click on the tags. For the most important ones a dialog box will open with all the fields filled in from your code.

Microsoft Internet Explorer as internal previewer

DDE support for Microsoft Internet Explorer and Netscape Navigator
Control Internet Explorer and Navigator/Communicator via DDE: Load all your previews in one instance of the browser.

Style Sheet Assistant
Create and modify style sheets with ease !

Local link checker

File weight tool

Table, List and URL   Assistants
Create error-free HTML code and URLs quickly !

TagInfo

TagComplete

Template function

Export to UNIX/Mac

Project support

Drag and drop support
Drag files from the **Filer** or the Windows explorer to work faster.

Fullscreen editing

TagInfo

The TagInfo feature is a useful feature that shows information about the tag you are just about to edit in a yellow box on the bottom of every open document. It gives information about the exact syntax of the HTML tag. The display will be updated every time you press a key or you click with the mouse.

You can set your preferences for this feature on the Options screen.

TagComplete

The TagComplete feature is intended to increase your writing speed. It completes the tag you begin. E.g. if you type <FONT , it will be completed to <FONT></FONT>.

You can set your preferences for this feature on the [Options screen](#).

Fullscreen editing

You can switch to fullscreen mode by either hitting **F12**, pressing the fullscreen button on the speedbar or by choosing **View - Full Screen**.
In fullscreen mode, all things except the editing window and the main menu are invisible.

Learning HTML

There are some really good resources for beginners available on the web:

WebAlley   http://free.prohosting.com/~weballey/
A beginners guide to HTML
          http://www.ncsa.uiuc.edu/Indices/Outreach/online-resources.html
Introduction to HTML   http://members.aol.com/htmlguru/index.html
The best german tutorial: SelfHTML   http://www.netzwelt.com/selfhtml/

Other good software is available here:

The HTMLtool website: surf by for plugins and other stuff http://www.poboxes.com/HTMLtool
MapThis - freeware image map editor   http://www.ecaetc.ohio-state.edu/tc/mt
WS_FTP LE - freeware FTP uploader   http://www.ipswitch.com/

Please check out my website http://www.poboxes.com/HTMLtool/links.html for more links.

HTML/CSS Reference

HTMLtool is distributed with a very good HTML reference: the Web Design Group HTML Reference 4.0.

Options/Settings

The Options screen allows you to specify you personal preferences.
You can open the screen by choosing **File - Options**, and then checking your personal preferences, (a default is set for each preference).

General
Word wrap
Turn word wrap on or off
Insert tags lowercase
Specifies whether tags are being inserted upper or lowercase
New document at startup
Open a new, empty document every time you start HTMLtool ?
Insert empty ALT attribute with dropped images
Insert an empty ALT attribute with every image dropped form the Filer onto a document ?
Make backup copies
Make backup copies with the extension .bak everytime you save ?
Save file before preview
Save the current file before previewing ?
Change Filer directory upon activation of MDI child
Make the directory of the document you activate the current directory in the Filer ?
Maximize editing windows upon creation
Maximize document window when you create or open a document ?

Toolbars
Standard Speedbar
Indicates whether to show or to hide the standard speedbar.
HTML Tags
Indicates whether to show or to hide the tabbed tags speedbar.
Color Speedbar
Indicates whether to show or to hide the color bar.
Status line
Indicates whether to show or to hide the status line.

Browser
Path
The path and filename of your browser
Browser is Netscape
Browser is Internet Explorer
Check the appropriate item. If you use Cello or another browser, check none. These checkboxes are to specify whether to use DDE with the chosen browser.
Use Internet Explorer as internal browser
This checkbox will only be available if you have IE installed on your computer. Uncheck it if you experience problems with it. See also: Internal Previewer

Help File
Path
Specifies the path and the filename of the external help file to be used.
Caption
The menu item that calls the help file will have this caption.

Filer
Use <IMG> tag with images
Insert an <IMG> tag with image files dropped from the Filer onto a document. If unchecked, an A

tag is used instead.

Insert text files

Uncheck if you want to have <A> tags pointing to the text file inserted instead.

PowerPanel alignment

Specify the alignment of the whole PowerPanel.

Startup folder

This folder will be the current one selected upon startup of HTMLtool.

Font

Font

Choose the font you want to be used as editor font.

Size

Specifies the font size.

TagComplete

Use the TagComplete feature

Specifies whether to enable or disable the TagComplete feature.

Require space bar pressed

Complete the tag only after the space bar has been pressed ?

New

Create a new TagComplete item.

Edit

Edit the selected TagComplete item.

Delete

Delete the selected TagComplete item.

TagInfo

Use the TagInfo feature

Enable or disable the TagInfo feature ?

Time

Specifies the time in seconds after which the TagInfo feature is to become active.

Other

Autosave after ... minutes

Specifies the time in minutes after which the software prompts you to save all open files. Enter 0 to disable this feature.

Scripts

HTMLtool provides a couple of scripts to improve your pages.
They can be used by double clicking on the appropriate entry of the scripts box.

How to add scripts to the scripts box
Just save your script to a file, name this file <something>.scp and copy it to the /Scripts subfolder of the HTMLtool folder.
The entry <something> will appear in the box the next time you start HTMLtool.
If you want to supply a small description that appears in the yellow box under the scripts box, you have to make the first line in your script-file look like this:
<HTMLtool>Description goes here. Maximum is one line.</HTMLtool>
