This *InfoBase* demonstrates **initializing *InfoText* from templates** and the use of *TextFields*. The initializing text is contained in an *InfoRecord* with the special (reserved) title '*******': When a new *InfoRecord* is created, after entering the title and then pressing **page down**, you jump to the first field of the *InfoText*, fill it out and so go along.

Note   This works only as described if you did not change the behaviour for the page keys with the Extras/Options command.

This "address management *InfoBase*" contains only two records, the template '*******' and our address. As a test, add a few of your addresses: command '**New Info**', enter title, with <**page down**> to the first *field* and so on.

Adjust the initializing text to your requirements**:** activate record '*******', edit its *InfoText* - all that is set between **{** and **}** is interpreted by *infoHandler* as a *TextField* where you can jump to.

Send us an e-mail**:** double-click on the e-mail address in the *InfoText* with our address and then select **Open** in menu **File** or press **Ctrl+O**. Tell us of your first impression of *infoHandler*!

Note: Of course there is an interesting alternative to organize the e-mail addresses of your partners in this infoBase. Enable it for *InfoLinks* (command **Properties** in menu **File**). Then enter the e-mail path, prefixed by 'mailto:', in the *InfoLink* field (by typing or dragging) of the various *InfoRecords*. Afterwards you send e-mail by just clicking on the icon in the *InfoList*.
