GDIdb Remote Help

GDIdb remote allows remote operation (script execution, publishing and file FTP upload) of GDIdb via a TCPIP network connection. GDIdb remote is not subject to the GDIdb "single CPU license" restriction, you may install remote.exe and associated help files on as many computers as you wish.

In order to use Remote, you must have checked Enable network control server (Under Network Control in the GDIdb Program Settings dialog). In addition, you must have created at least one user account (by adding a username and a password under Network Users).

Remote Settings:
GDIdb Server details:
You must enter either the domain name or IP address of the server on which GDIdb is running, in addition to the network port that GDIdb uses for remote operation (the default is 124).

GDIdb Project
Project
Enter the name of the project you wish to use for Publish or Run operations. If you wish to use the current GDIdb project leave this text box blank.

Script
Enter the name of the project   script you wish to execute on Run operations. If you wish to use the current GDIdb off-line project script leave this text box blank.

Logon Details:
Enter a valid GDIdb Username and Password. GDIdb user accounts may be created by adding the username/password under Network Control in the GDIdb Program Settings dialog.
