

Loading Images from a file

This is a simple demo showing how to load an image from a file. Note that this demo only runs in native mode

Concepts shown

- How to load and convert an image from a file. Note that you have to define what image format you want on the template, and this can be only JPEG or PNG. If the file you want to load is not in the template format, you have to convert it first. You can read more on the *Images from database* demos.
