

Basic steps to create a Template Report:

1. First, you have to tell FlexCel in what cells you want to replace the values. To replace values in a given sheet, always define a **__XXXX__** name there. If you don't define anything, FlexCel won't do anything either, allowing it to skip processing in sheets where you don't want to.
2. After that you have to tell FlexCel what cells you want to change. To do this, write either **##DatasetName##FieldName** or **#.Property** in those cells. The **##** is for replacing values from a database, while the **#.** is for replacing with published properties.

Also, a special case is shown. Excel doesn't have a Date datatype, so, FlexCel sends all Dates as Numbers. You have to format all cells that will contain dates as Date, if not, you will see numbers.
