

XLSTemplateStore

This component allows you to link the templates directly into the exe, so you don't have to distribute additional files. It only works in native mode, and it's very easy to use. Just drop one into the data module, connect it to a TXLSAdapter, and load the templates using the "Templates" property.

Note: Using a TemplateStore means that each time you want to change a template, you have to load it again and recompile your app. Depending on the kind of application you are doing, this might be an advantage or a disadvantage... Personally, I don't use TemplateStores and just distribute the files so I can modify them when I want to, but again, it depends of you and your specific needing.

Properties

property Templates: TXIsTemplateList

Click on the ellipsis ("...") button to access the template list. There you can add new files to the store, or delete the ones you don't need. After you add a new entry, select its "Filename" property, and browse for the file you want to include.

Note Once you have loaded a new file, there is no easy way to get it back from the store, so always keep the originals!

property Compress: boolean

This property is not yet implemented. It will allow you to compress the resource linked with the exe, to get a smaller application.
