What Is SpamSieve?

SpamSieve gives you back your inbox by bringing powerful Bayesian spam filtering to popular e-mail clients. It learns what your spam looks like, so it can block nearly all of it. Other spam filters get worse over time as spammers adapt to their rules; SpamSieve actually gets better over time as you train it with more messages.

Requirements

SpamSieve requires Mac OS X 10.2.6 or later. Mac OS X 10.3.3 or later is recommended. SpamSieve works with: Apple Mail, Emailer, Entourage, Eudora, Mailsmith, Outlook Express, and PowerMail.

Installing

Drag the SpamSieve application icon into your Applications folder. The full SpamSieve documentation is available in PDF and HTML formats. To view it, double-click the SpamSieve application icon and then look in SpamSieve's **Help** menu. To finish installing SpamSieve, please see Section 2.3 of the SpamSieve Manual.

Updating to SpamSieve 2.1.4

Quit the SpamSieve application and then replace the old application file with the new one. That is, if SpamSieve is installed in the `Applications` folder, drag the new SpamSieve application icon into the `Applications` folder and click **Replace** when the Finder asks if you want to overwrite the old version. Then double-click the new version to launch it.

Apple Mail users should choose **Install Apple Mail Plug-In and Scripts** from the **SpamSieve** menu. Eudora users should choose **Install Eudora Plug-In** from the **Spam-Sieve** menu. Users of other e-mail clients do not need to do anything else to update to SpamSieve 2.1.4.
