

This function will use the Microsoft disk checking utility to examine your hard disk drive for errors in the **filing or indexing systems**.

The type of check which will be performed is known as a "**standard**" check and it can fix problems before you even notice them.

This check is **very import** because an uncorrected error can spread through your data and result in the loss of all the files on your computer in the worst cases.

We recommend that you **check you drives for errors** at least **once a week**.
