

GEOCLOCK 7.0 sunlight clock for Windows. The current sun position is displayed, and the parts of the earth in sunlight and twilight are highlighted, with local sunrise/set and times around the world. A DOS version (GEOCLK70.ZIP) is also available, and the two versions are functionally and graphically similar. Over 200 maps and a spinning globe program are available.

To install version 7.0 of GeoClock, unpack all the files in GCKWIN70 (and GEOXTR70 or GEOCLK70 if you have it) in a directory on your hard disk, and run GEOCKWIN and click FILES|SETUP to customize the program for your location and hardware. GEOCKWIN runs the program.

If you have a registered version of GeoClock and are updating to 7.0 (DOS or Windows), you can install the new programs over the old, or set up a new directory. In either case, you must run the REGISTER.EXE program from your original installation.

The only limitations on the shareware version are:  
The system always starts and stops with the about box.  
A limited number of maps are available.  
Local time display next to cities on the map is not available.
