

## Areas Collection

The **Areas** Collection contains a collection of area objects for every area in the report. Access a specific **Area** Object in the collection using the Item property.

## Properties

**Application** - Returns a reference to the **Application** Object this object is associated with. Read only.

**Count** - Returns the number of areas in the collection. Read only.

**Item** - Returns **Area** Object. Item has an index parameter that can be either a string reference to the area (i.e., "RH", "PH", "GHn", "D", "GFn", "PF", or "RF") or a numeric, 1-based index (i.e., Item (1) for the Report Header area). The items in the collection are indexed in the order they are listed for each section/area. Read only.

**Parent** - Reference to the Parent object (**Report** Object). Read only.

**Report** - Reference to **Report** Object. Read only.

## Remarks

Instead of using the Item property as shown, you can reference an area directly; for example, Areas ("RH") or Areas (1).
