

DatabaseTables Collection

The **DatabaseTables** Collection is a collection of DatabaseTable objects. A DatabaseTable object exists for every database object (i.e., table, query, stored procedure, etc.) accessed by the report. Access a specific **DatabaseTable** Object in the collection using the Item property.

Properties

Application - Returns a reference to the **Application** Object this object is associated with. Read only.

Count - Returns the number of database objects in the collection. Read only.

Item - Returns **DatabaseTable** Object. Item has an index parameter that can be either a string reference to the table, (i.e., Item("Categories")) or a numeric, 1-based index (i.e., Item (1)). When a numeric index is used, the items in the collection are indexed in the order they were added to the report. Read only.

Parent - Reference to the Parent object (**Database**). Read only.

Report - Reference to **Report** Object. Read only.

Remarks

Instead of using the Item property as shown, you can reference a table directly, for example, DatabaseTable("Categories") or DatabaseTable(1).
